

What You Make Possible

IPv6 Security Threats and Mitigations

BRKSEC-2003

Session Objectives

- Leverage existing IPv4 network security knowledge
- Advanced IPv6 security topics like transition options and dual stack environments
- Requirements: basic knowledge of the IPv6 and IPsec protocols as well as IPv4 network security best practices

For Reference Slides

- There are more slides in the hand-outs than presented during the class
- Those slides are mainly for reference and are indicated by the book icon on the top right corner (as on this slide)
- Some reference URL have a QR for your convenience

Agenda

- Debunking IPv6 Myths
- Shared Issues by IPv4 and IPv6
- Specific Issues for IPv6
 - Extension headers, IPsec everywhere, transition techniques
- Enforcing a Security Policy in IPv6
 - ACL, Firewalls and IPS
- Enterprise Secure Deployment
 - Secure IPv6 transport over public network

IPv6 Security Myths...

IPv6 Myths: Better, Faster, More Secure

Sometimes, newer means better and more secure

Sometimes, experience IS better and safer!

The Absence of Reconnaissance Myth

- Default subnets in IPv6 have 2^{64} addresses
 - 10 Mpps = more than 50 000 years

Reconnaissance in IPv6

Scanning Methods Will Change

- Public servers will still need to be DNS reachable
 - More information collected by Google...
- Increased deployment/reliance on dynamic DNS
 - More information will be in DNS
- Using peer-to-peer clients gives IPv6 addresses of peers
- Administrators may adopt easy-to-remember addresses (::10,::20,::F00D, ::C5C0, :ABBA:BABE or simply IPv4 last octet for dual stack)
- By compromising hosts in a network, an attacker can learn new addresses to scan

Viruses and Worms in IPv6

- Viruses and email, IM worms: IPv6 brings no change
- Other worms:
 - IPv4: reliance on network scanning
 - IPv6: not so easy (**see reconnaissance**) => will use alternative techniques

- Worm developers will adapt to IPv6
- IPv4 best practices around worm detection and mitigation remain valid

Scanning Made Bad for CPU

Remote Neighbour Cache Exhaustion

- Potential router CPU/memory attacks if aggressive scanning
 - Router will do Neighbour Discovery... And waste CPU and memory
- Local router DoS with NS/RS/...

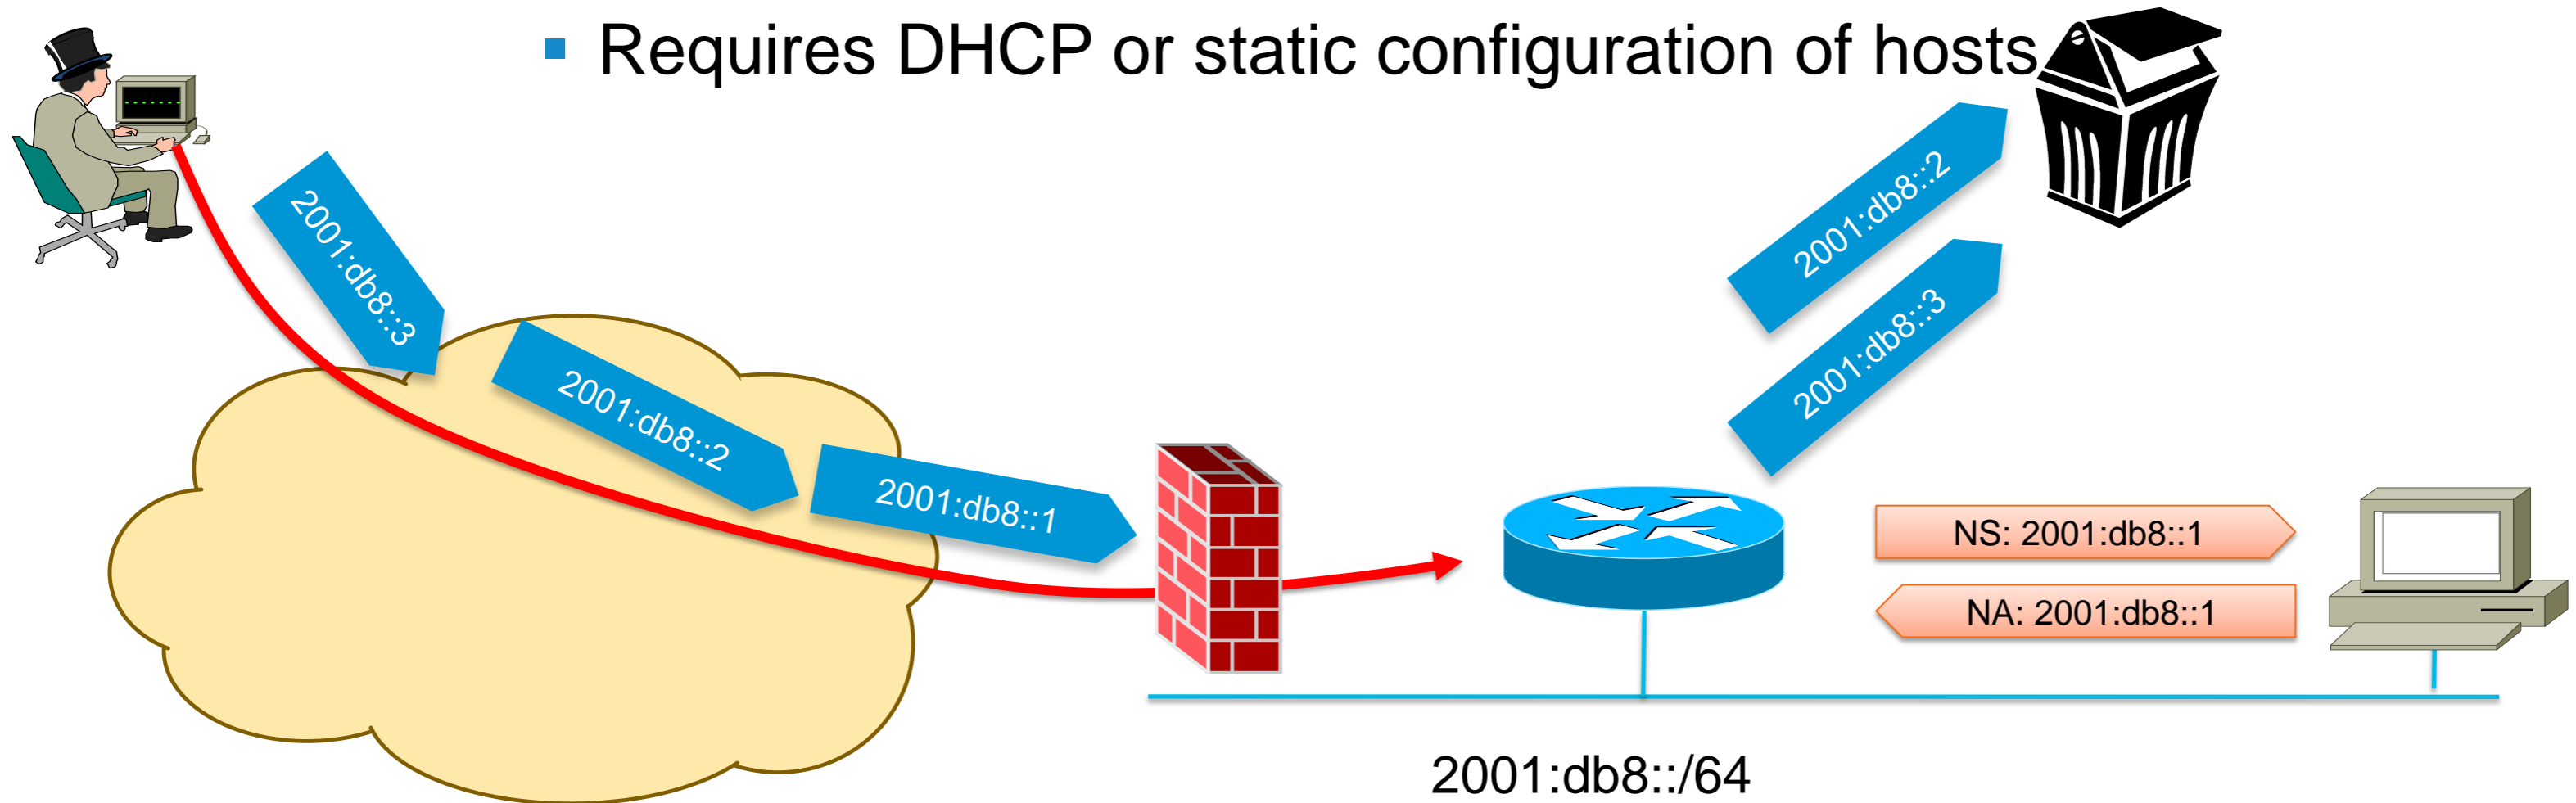

Mitigating Remote Neighbour Cache Exhaustion

- Built-in rate limiter but no option to tune it
 - Since 15.1(3)T: `ipv6 nd cache interface-limit`
 - Or IOS-XE 2.6: `ipv6 nd resolution data limit`
 - **Destination-guard** is part of First Hop Security phase 3
- Using a /64 on **point-to-point links** => a lot of addresses to scan!
 - Using /127 could help (RFC 6164)
- **Internet edge/presence**: a target of choice
 - Ingress ACL permitting traffic to specific statically configured (virtual) IPv6 addresses only
- Using infrastructure ACL prevents this scanning
 - iACL: edge ACL denying packets addressed to your routers
 - Easy with IPv6 because new addressing scheme can be done 😊

Simple Fix for Remote Neighbour Cache Exhaustion

- Ingress ACL allowing only valid destination and dropping the rest
- NDP cache & process are safe
- Requires DHCP or static configuration of hosts

Reconnaissance in IPv6?

Easy with Multicast!

- No need for reconnaissance anymore
- 3 site-local multicast addresses (not enabled by default)
 - FF05::2 all-routers, FF05::FB mDNSv6, FF05::1:3 all DHCP servers
- Several link-local multicast addresses (enabled by default)
 - FF02::1 all nodes, FF02::2 all routers, FF02::F all UPnP, ...

Source	Destination	Payload
Attacker	FF05::1:3	DHCP Attack

<http://www.iana.org/assignments/ipv6-multicast-addresses/>

The IPsec Myth:

IPsec End-to-End will Save the World

- “IPv6 mandates the implementation of IPsec”
- Some organisations believe that IPsec should be used to secure all flows...

“Security expert, W., a professor at the University of <foo> in the UK, told <newspaper> the new protocol system – IPv6 – comes with a security code known as IPSEC that would do away with anonymity on the web.

If enacted globally, this would make it easier to catch cyber criminals, Prof W. said.”

The IPsec Myth:

IPsec End-to-End will Save the World

- IPv6 originally mandated the implementation of IPsec (but not its use)
- Now, RFC 6434 “IPsec **SHOULD** be supported by all IPv6 nodes”
- Some organisations still believe that IPsec should be used to secure all flows...
 - Interesting **scalability** issue (n^2 issue with IPsec)
 - Need to **trust endpoints and end-users** because the network cannot secure the traffic: no IPS, no ACL, no firewall
 - IOS 12.4(20)T can parse the AH
 - Network **telemetry is blinded**: NetFlow of little use
 - Network **services hindered**: what about QoS?

Recommendation: do not use IPsec end to end within an administrative domain.

Suggestion: Reserve IPsec for residential or hostile environment or high profile targets EXACTLY as for IPv4

Quick Reminder

IPv4 Broadcast Amplification: Smurf

The No Amplification Attack Myth

IPv6 and Broadcasts

- There are no broadcast addresses in IPv6
- Broadcast address functionality is replaced with appropriate link local multicast addresses
 - Link Local All Nodes Multicast—FF02::1
 - Link Local All Routers Multicast—FF02::2
 - Link Local All mDNS Multicast—FF02::FB
- ***Note: anti-spoofing also blocks amplification attacks because a remote attacker cannot masquerade as his victim***

<http://iana.org/assignments/ipv6-multicast-addresses/>

IPv6 and Other Amplification Vectors

- RFC 4443 ICMPv6
 - No ping-pong on a physical point-to-point link Section 3.1
 - No ICMP error message should be generated in response to a packet with a multicast destination address Section 2.4 (e.3)
 - Exceptions for Section 2.4 (e.3)
 - packet too big message
 - the parameter problem message
 - ICMP information message (echo reply) should be generated even if destination is multicast

•Rate Limit egress ICMP Packets

•Rate limit ICMP messages generation

•Secure the multicast network (source specific multicast)

•Note: Implement Ingress Filtering of Packets with IPv6 Multicast Source Addresses

•Note: anti-spoofing also blocks amplification attacks because a remote attacker cannot masquerade as his victim

Shared Issues

IPv6 Bogon and Anti-Spoofing Filtering

- Bogon filtering (data plane & BGP route-map):
<http://www.cymru.com/Bogons/ipv6.txt>
- Anti-spoofing = uRPF

Remote Triggered Black Hole

- RFC 5635 RTBH is easy in IPv6 as in IPv4
- uRPF is also your friend for blackholing a source
- RFC 6666 has a specific discard prefix
100::/64

IPv6 Routing Header

- An extension header
- Processed by the listed intermediate routers
- Two types (*)
 - Type 0: similar to IPv4 source routing (multiple intermediate routers)
 - Type 2: used for mobile IPv6

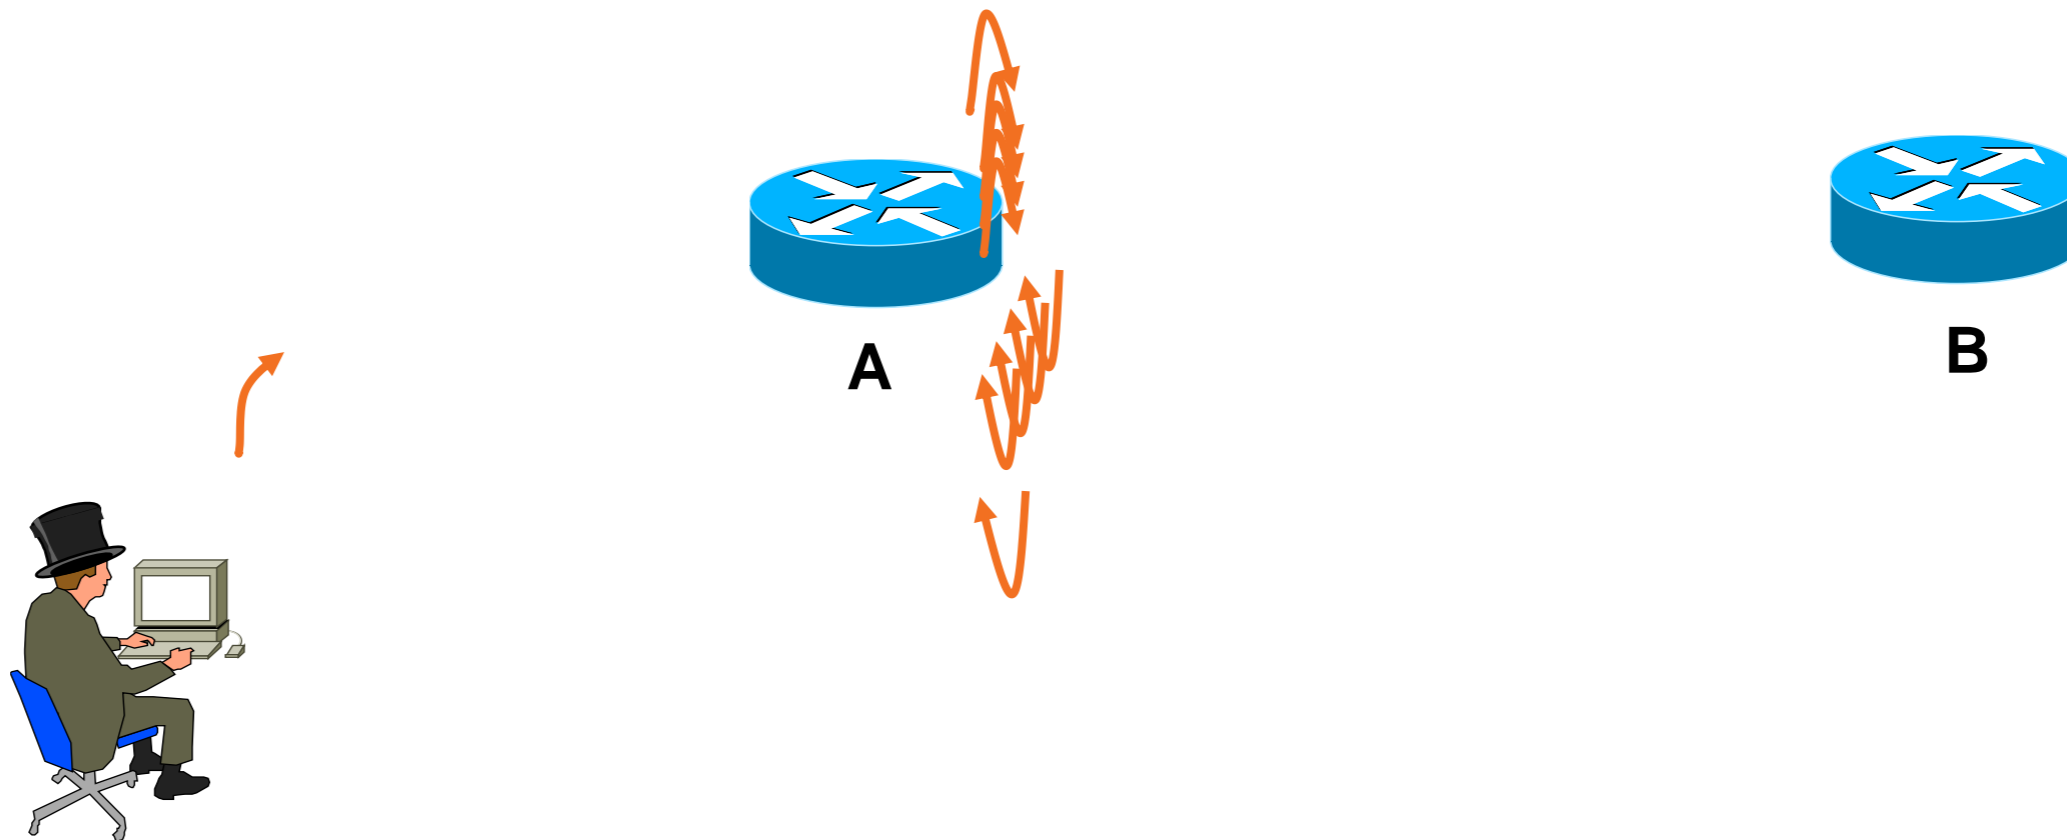

*: <http://tools.ietf.org/html/draft-ietf-6man-rpl-routing-header> (work in progress, should be OK for security)

Type 0 Routing Header

Issue #2: Amplification Attack

- What if attacker sends a packet with RH containing
 - A -> B -> A -> B -> A -> B -> A -> B -> A
- Packet will loop multiple time on the link A-B
- An amplification attack!

Preventing Routing Header Attacks

- Apply same policy for IPv6 as for Ipv4:
 - Block Routing Header type 0
- Prevent processing at the intermediate nodes
 - *no ipv6 source-route*
 - Windows, Linux, Mac OS: default setting
 - IOS-XR before 4.0: a bug prevented the processing of RH0
 - IOS before 12.4(15)T: by default RH0 were processed
- At the edge
 - With an ACL blocking routing header
- RFC 5095 (Dec 2007) RH0 is deprecated
 - Default changed in IOS 12.4(15)T and IOS-XR 4.0 to ignore and drop RH0

Neighbour Discovery Issue#1

SLAAC Rogue Router Advertisement

Router Advertisements contains:

- Prefix to be used by hosts
- Data-link layer address of the router
- Miscellaneous options: MTU, DHCPv6 use, ...

RA w/o Any Authentication
Gives Exactly Same Level of
Security as DHCPv4 (None)

1. RS:

-Data = Query: please send RA

2. RA:

-Data= options, **prefix**, lifetime, **A+M+O** flags

Neighbour Discovery Issue#2

Neighbour Solicitation

Src = A
Dst = Solicited-node multicast of B
ICMP type = 135
Data = link-layer address of A
Query: what is your link address?

Src = B
Dst = A
ICMP type = 136
Data = link-layer address of B

**A and B Can Now Exchange
Packets on This Link**

Security Mechanisms
Built into Discovery
Protocol = None

=> Very similar to ARP

Attack Tool:
Parasite6
Answer to all NS,
Claiming to Be All
Systems in the LAN...

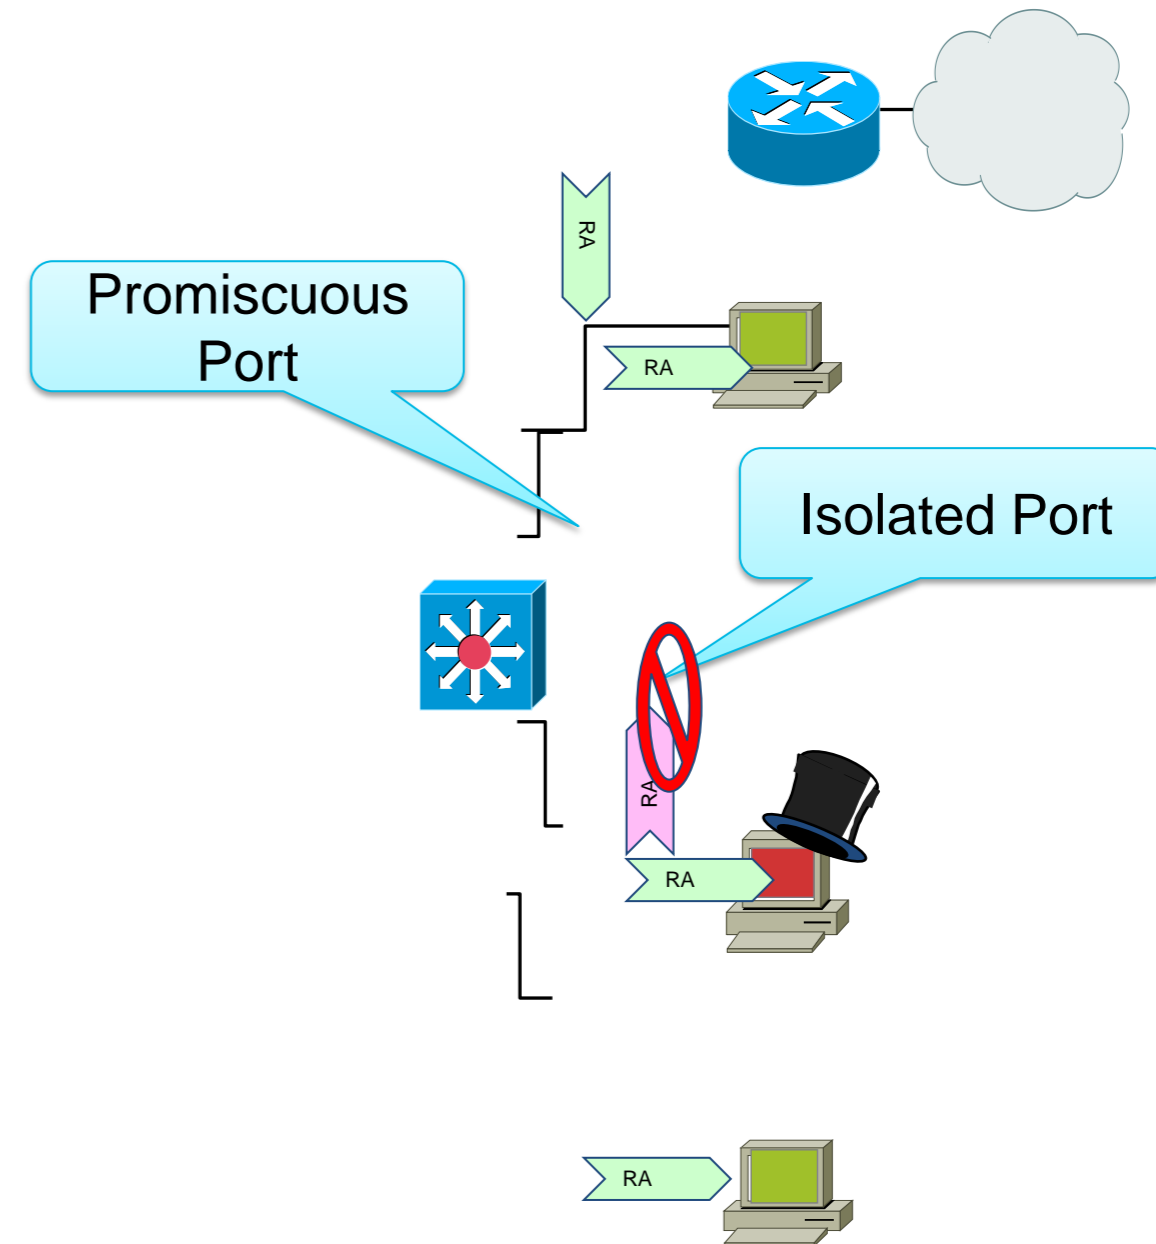

ARP Spoofing is now NDP Spoofing: Mitigation

- **MOSTLY GOOD NEWS:** dynamic ARP inspection for IPv6 is available (but not yet on all platforms)
 - First phase (Port ACL & RA Guard) available since Summer 2010
 - Second phase (NDP & DHCP snooping) starting to be available since Summer 2011
 - http://www.cisco.com/en/US/docs/ios/ipv6/configuration/guide/ip6-first_hop_security.html
- **GOOD NEWS:** Secure Neighbour Discovery
 - SeND = NDP + crypto
 - IOS 12.4(24)T
 - But not in Windows Vista, 2008 and 7, Mac OS/X, iOS, Android
 - Crypto means slower...
- Other **GOOD NEWS:**
 - Private VLAN works with IPv6
 - Port security works with IPv6
 - IEEE 801.X works with IPv6 (except downloadable ACL)

Mitigating Rogue RA: Host Isolation

- Prevent Node-Node Layer-2 communication by using:
 - Private VLANs (PVLAN) where nodes (isolated port) can only contact the official router (promiscuous port)
 - WLAN in 'AP Isolation Mode'
 - 1 VLAN per host (SP access network with Broadband Network Gateway)
- Link-local multicast (RA, DHCP request, etc) sent only to the local official router: no harm
 - Side effect: breaks DAD

Secure Neighbour Discovery (SeND)

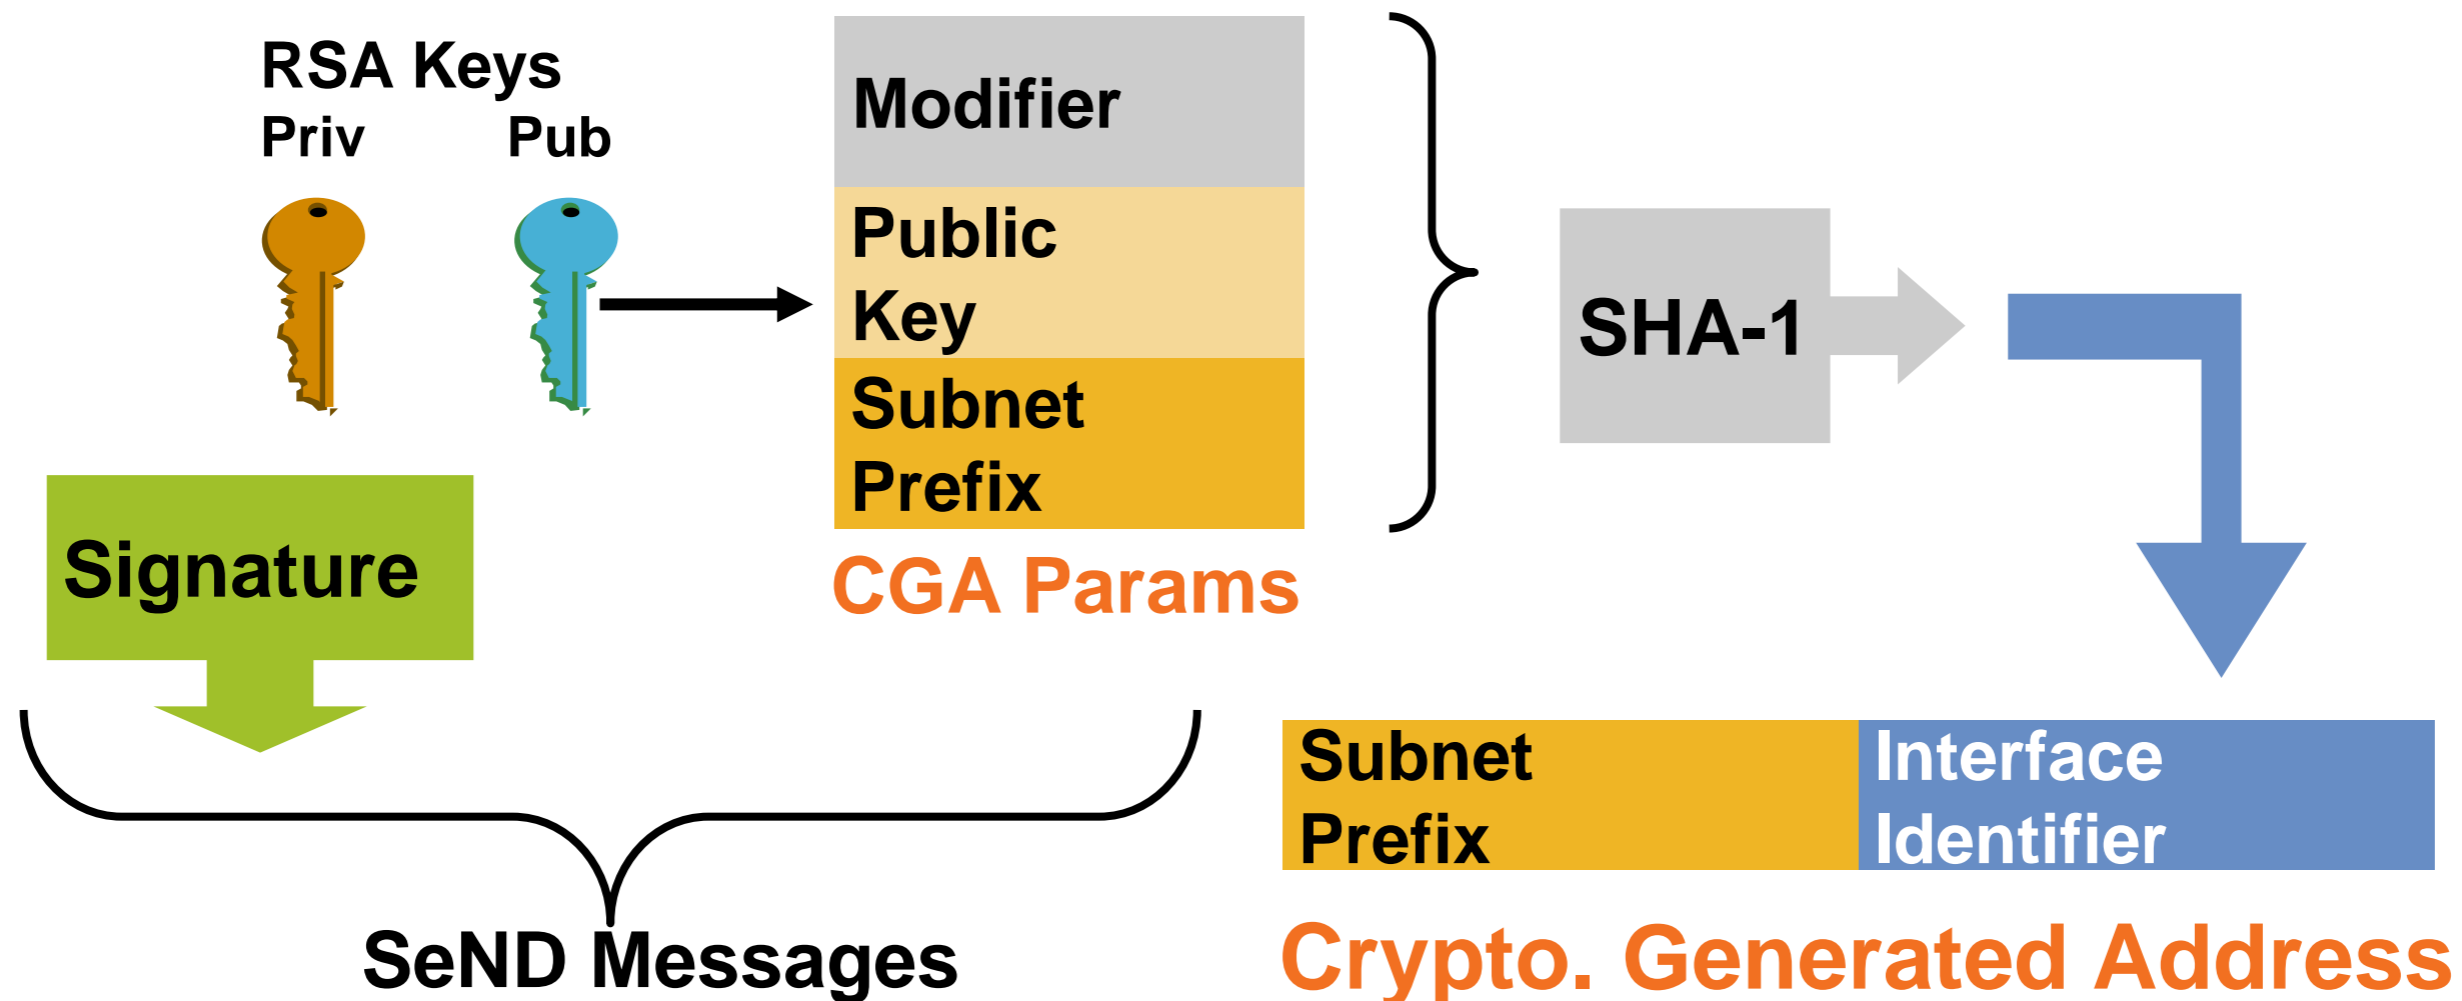

RFC 3971

- Certification paths
 - Anchored on trusted parties, expected to certify the authority of the routers on some prefixes
- Cryptographically Generated Addresses (CGA)
 - IPv6 addresses whose interface identifiers are cryptographically generated
- RSA signature option
 - Protect all messages relating to neighbour and router discovery
- Timestamp and nonce options
 - Prevent replay attacks
- Requires IOS 12.4(24)T (and crypto image/license)

Cryptographically Generated Addresses

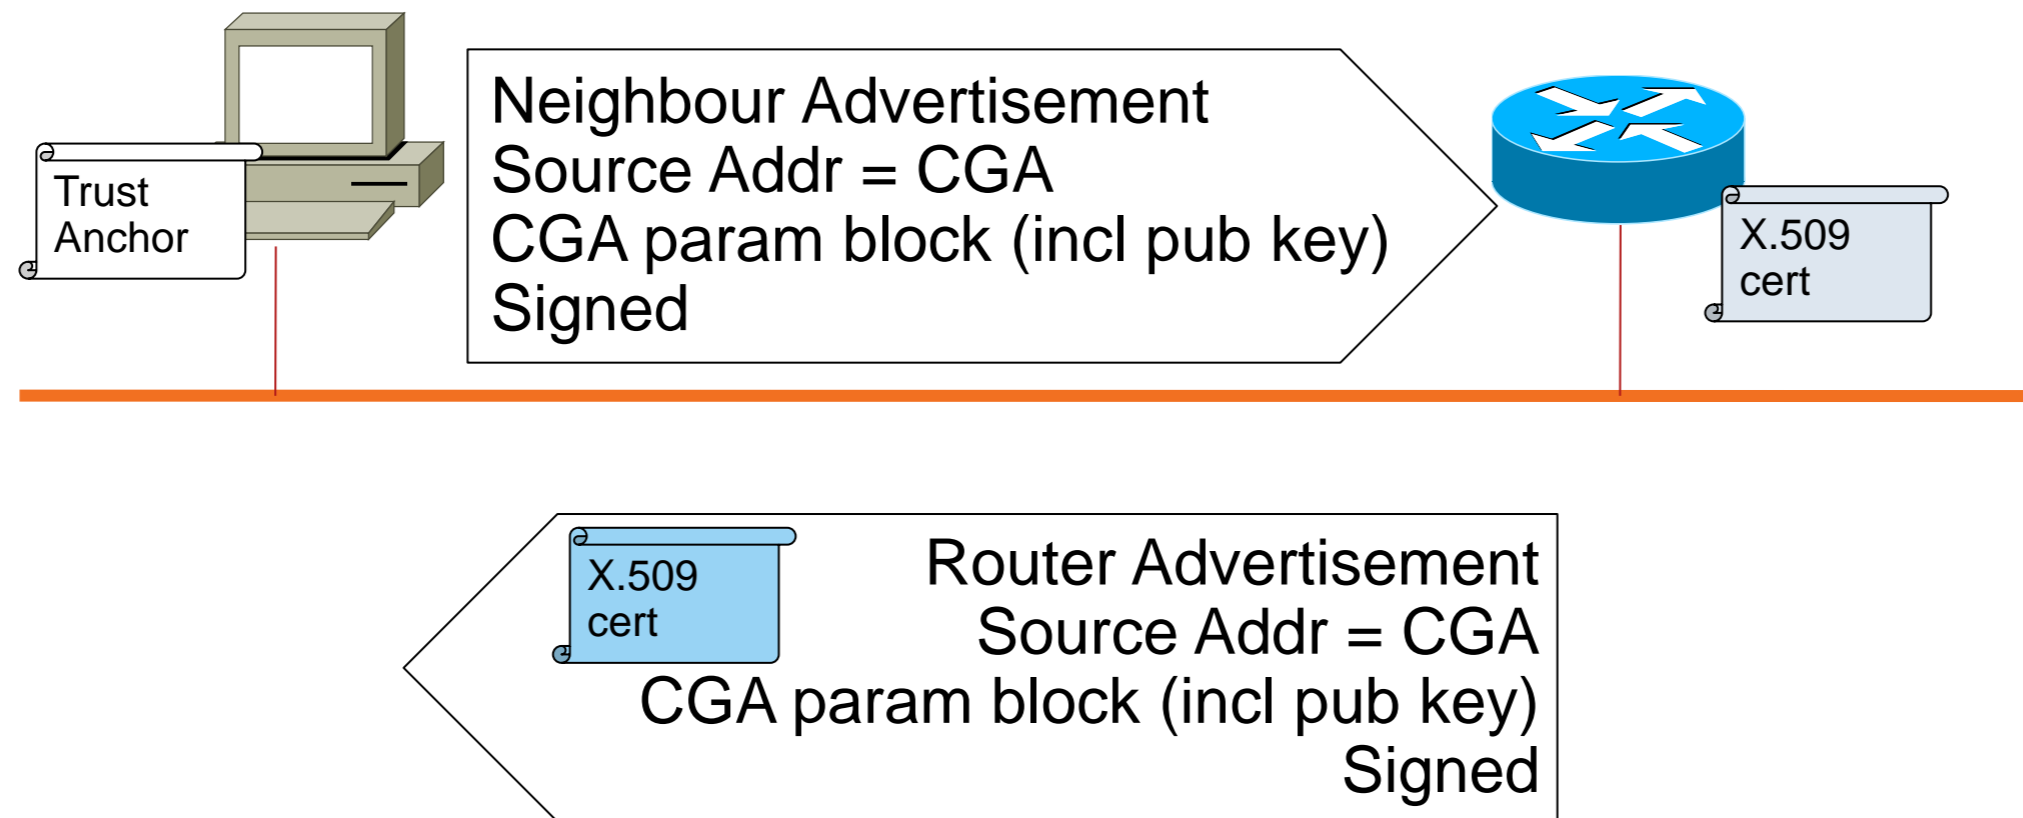

CGA RFC 3972 (Simplified)

- Each devices has a RSA key pair (no need for cert)
- Ultra light check for validity
- Prevent spoofing a valid CGA address

Securing Neighbour and Router Advertisements with SeND

- Adding a X.509 certificate to RA
- Subject Name contains the list of authorised IPv6 prefixes

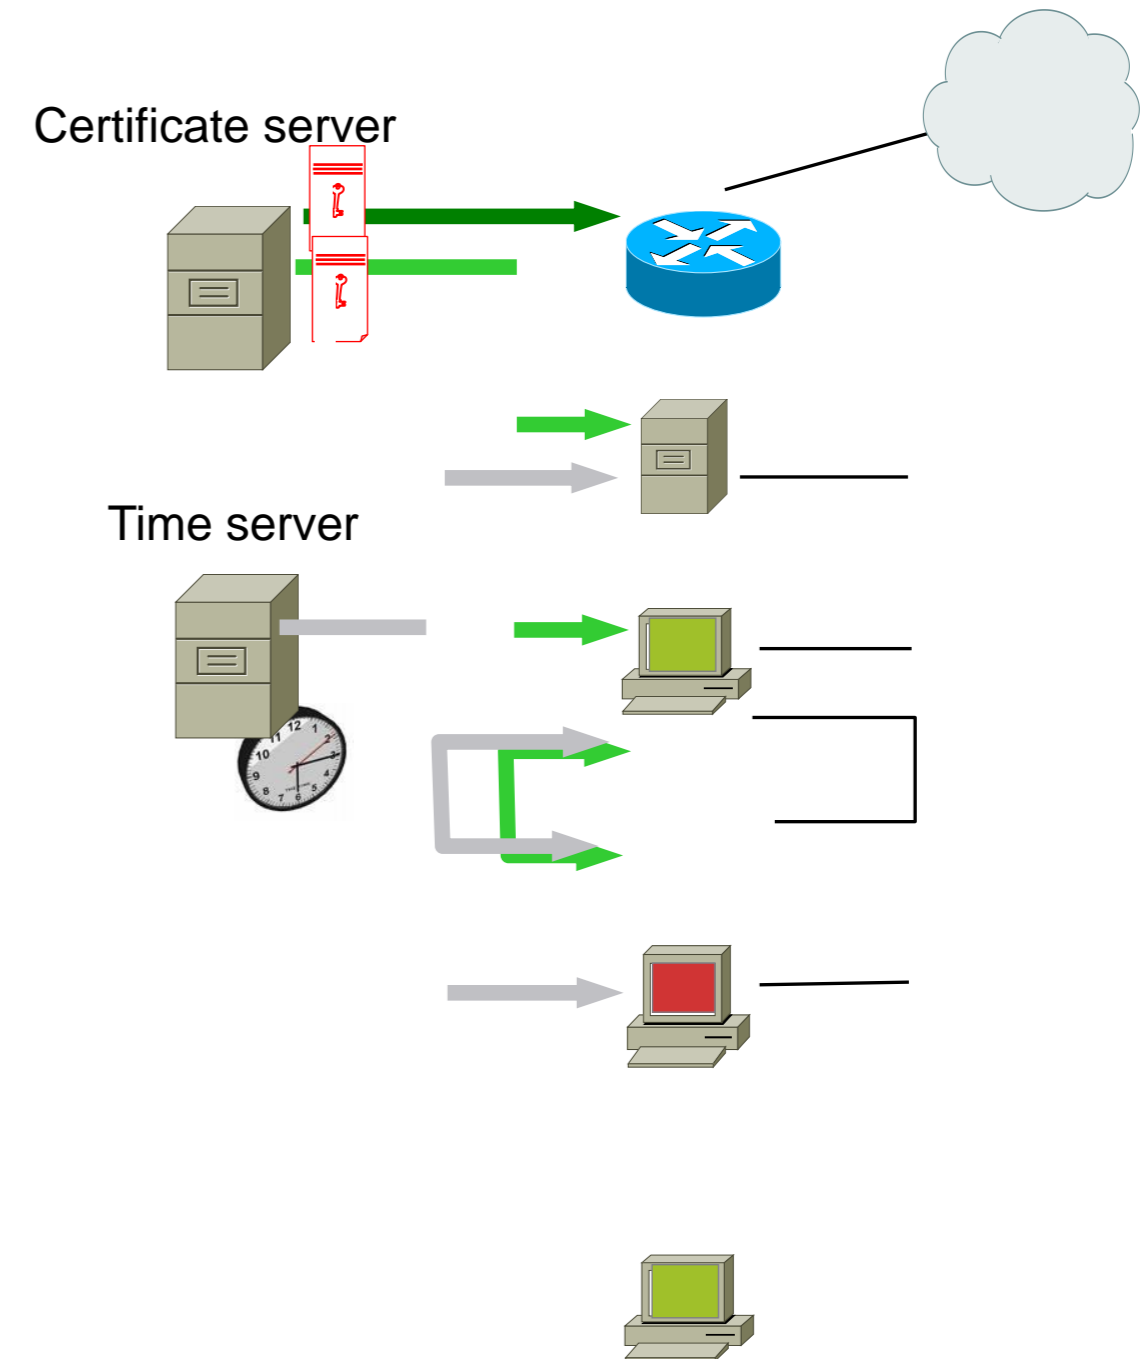

Securing Link Operations: Original IETF model on Nodes?

■ Advantages

- No central administration, no central operation
- No bottleneck, no single-point of failure
- Intrinsic part of the link-operations
- Efficient for threats coming from the link

■ Disadvantages

- Heavy provisioning of end-nodes
- Poor for threats coming from outside the link
- Bootstrapping issue
- Complexity spread all over the domain.
- Transitioning quite painful

Securing Link Operations: First Hop Trusted Device

Cisco Current Roadmap
IETF SAVI WG

■ Advantages

- central administration, central operation
- Complexity limited to first hop
- Transitioning lot easier
- Efficient for threats coming from the link
- Efficient for threats coming from outside

■ Disadvantages

- Applicable only to certain topologies
- Requires first-hop to learn about end-nodes
- First-hop is a bottleneck and single-point of failure

First Hop Security: RAguard since 2010

- **Port ACL** blocks all ICMPv6 RA from hosts

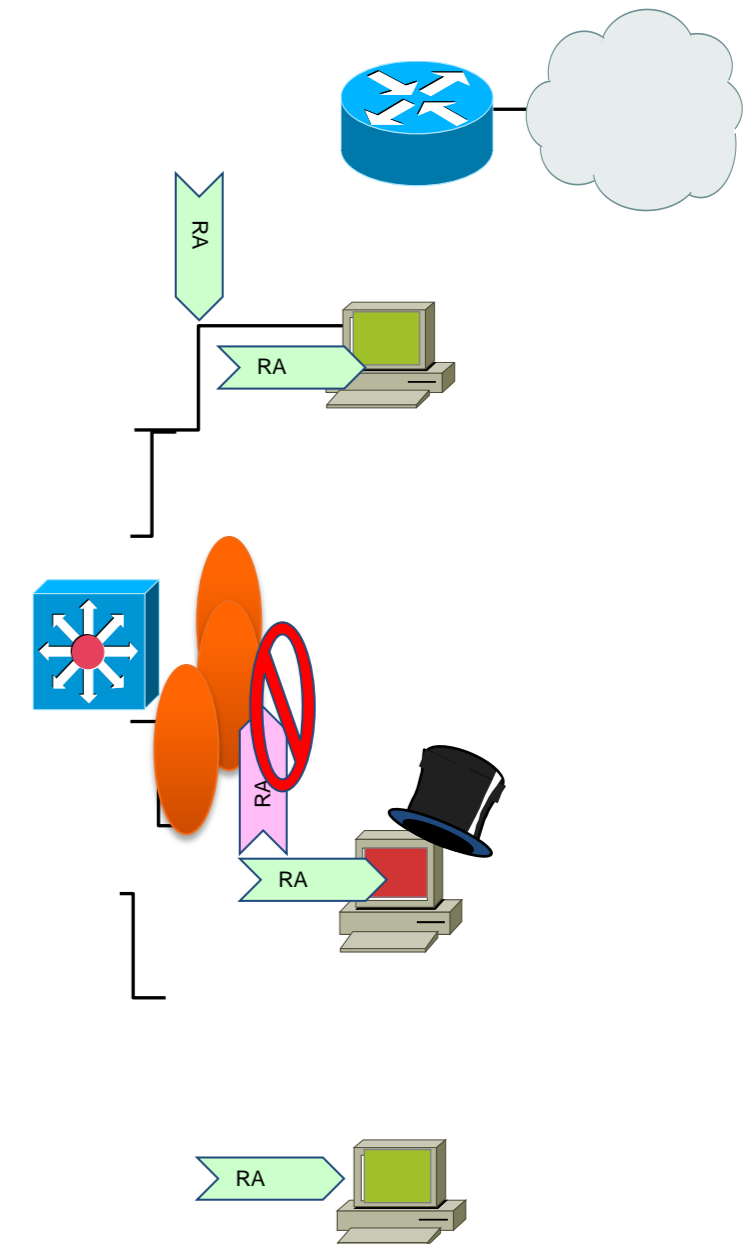

```
interface FastEthernet0/2
  ipv6 traffic-filter ACCESS_PORT in
  access-group mode prefer port
```

- **RA-guard lite** (12.2(33)SX14 & 12.2(54)SG): also dropping all RA received on this port

```
interface FastEthernet0/2
  ipv6 nd raguard
  access-group mode prefer port
```

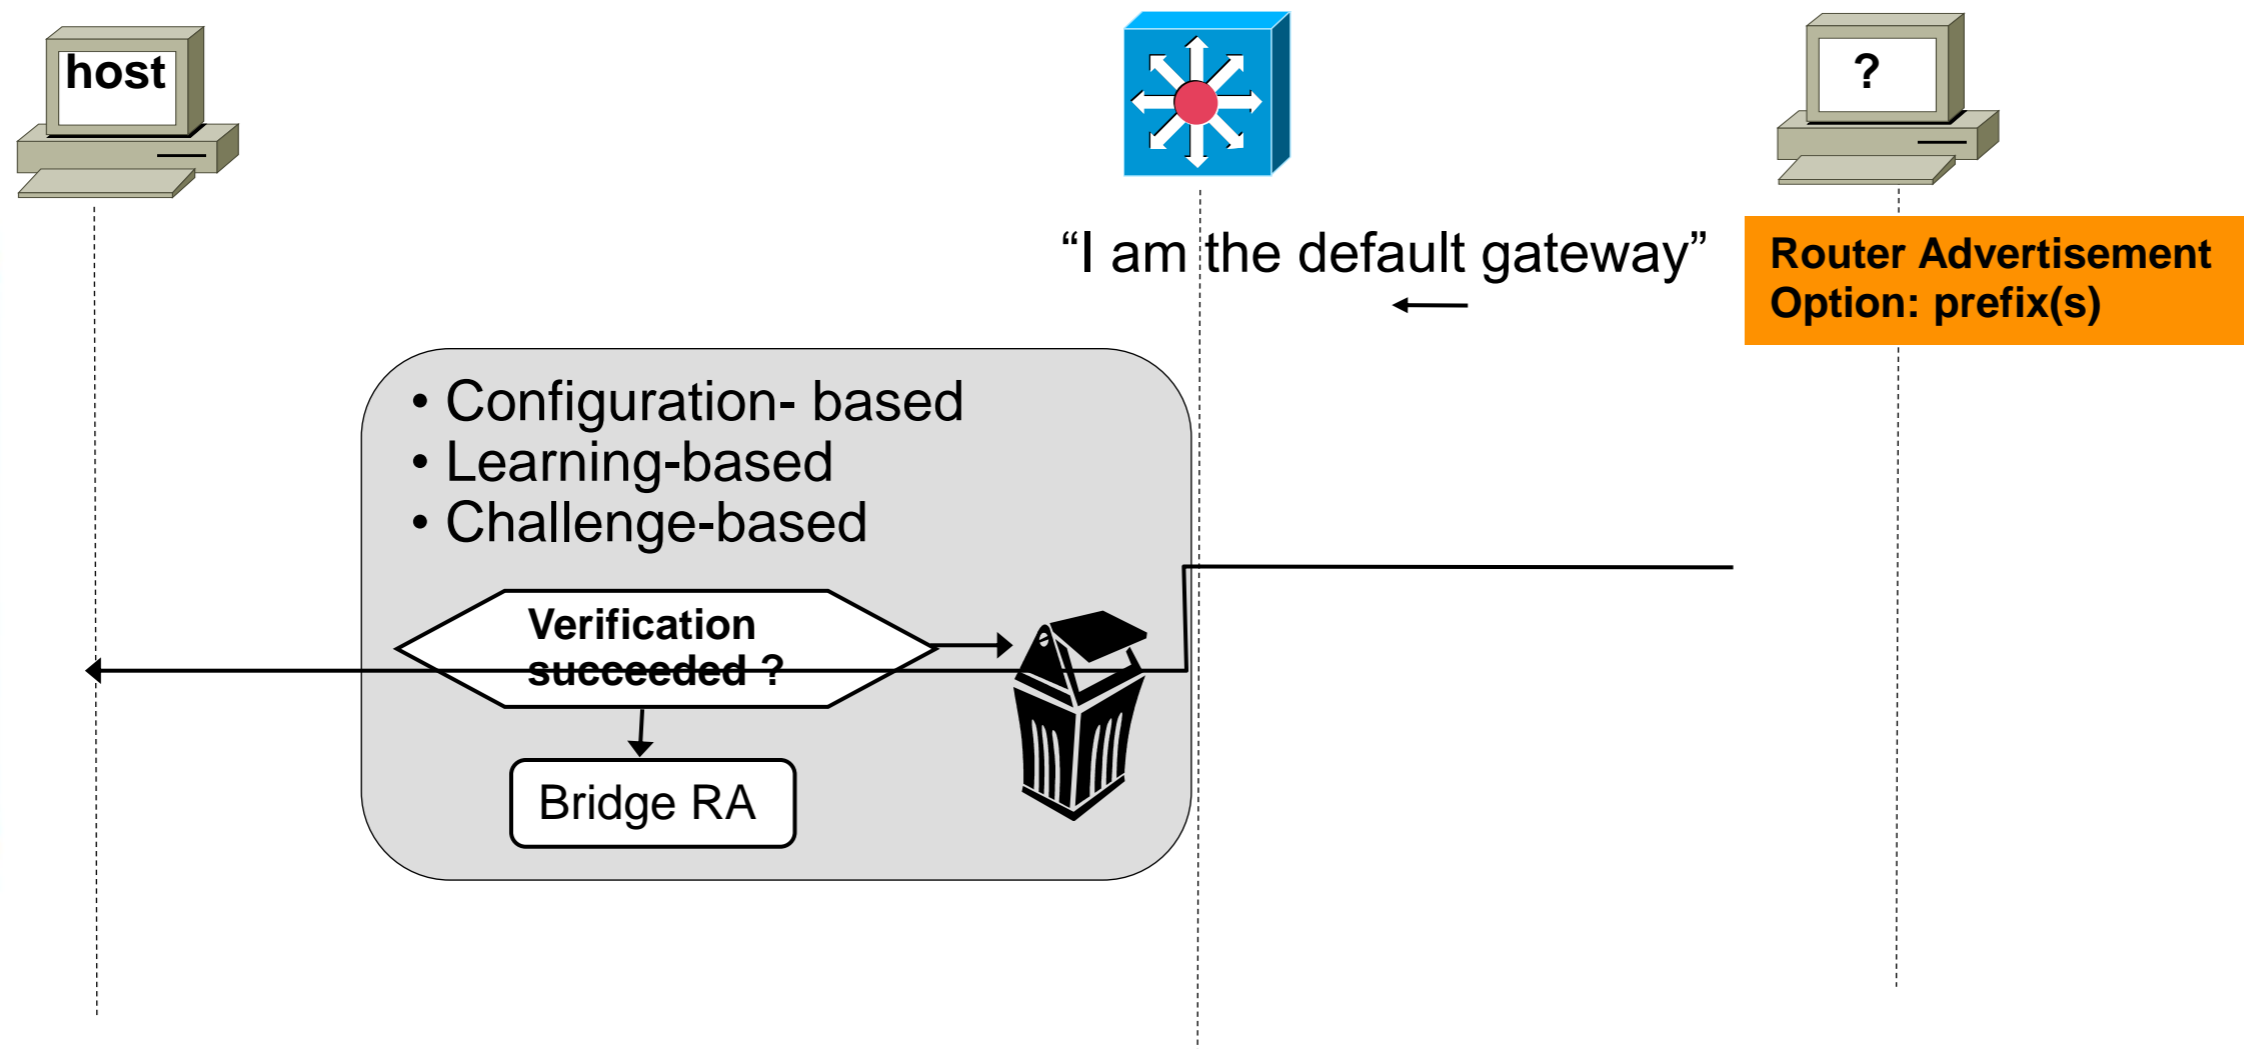

- **RA-guard** (12.2(50)SY, 15.0(2)SE)

```
ipv6 nd raguard policy HOST device-role host
ipv6 nd raguard policy ROUTER device-role router
ipv6 nd raguard attach-policy HOST vlan 100
interface FastEthernet0/0
  ipv6 nd raguard attach-policy ROUTER
```

RA-Guard

Goal: mitigate against rogue RA

- Switch selectively accepts or rejects RAs based on various criteria's
- Can be ACL based, learning based or challenge (SeND) based.
- Hosts see only allowed RAs, and RAs with allowed content

First Hop Security in June 2012

- IPv6 port ACL & RA Guard lite: 12.2(54)SG, 3.2.0SG, 15.0(2)SG, 12.2(33)SXI4
- NDP inspection (binding integrity guard): 12.2(50)SY, 15.0(1)SY, 15.0(2)SE

For more Information:

<http://www.cisco.com/en/US/docs/ios/ipv6/configuration/guide/ip6-roadmap.html>

<http://www.cisco.com/en/US/docs/ios-xml/ios/ipv6/configuration/15-2mt/ip6-first-hop-security.html>

IPv6 and the LAN Access

IPv6 FHS	C6K	C4K	C3K	C2K	WLC
RA Guard	12.2(50)SY and 15.0(1)SY	12.2(54)S G	15.0(2)S E	15.0(2)S E	7.2
DHCP Guard	2013	Q4 CY12	15.0(2)S E	15.0(2)S E	7.2
Binding Integrity Guard	2013	Q4 CY12	15.0(2)S E	15.0(2)S E	7.2
Source Guard	2013	MID 2013	15.0(2)S E	15.0(2)S E	7.2
Destination Guard	2013	Q4 CY12	15.0(2)S E	15.0(2)S E	7.2

ICMPv4 vs. ICMPv6

- Significant changes
- More relied upon

ICMP Message Type	ICMPv4	ICMPv6
Connectivity Checks	X	X
Informational/Error Messaging	X	X
Fragmentation Needed Notification	X	X
Address Assignment		X
Address Resolution		X
Router Discovery		X
Multicast Group Management		X
Mobile IPv6 Support		X

- => ICMP policy on firewalls needs to change

Generic ICMPv4

Border Firewall Policy

Action	Src	Dst	ICMPv4 Type	ICMPv4 Code	Name
Permit	Any	A	0	0	Echo Reply
Permit	Any	A	8	0	Echo Request
Permit	Any	A	3	0	Dst. Unreachable— Net Unreachable
Permit	Any	A	3	4	Dst. Unreachable— Frag. Needed
Permit	Any	A	11	0	Time Exceeded— TTL Exceeded

Equivalent ICMPv6

RFC 4890: Border Firewall Transit Policy

Action	Src	Dst	ICMPv6 Type	ICMPv6 Code	Name
Permit	Any	A	128	0	Echo Reply
Permit	Any	A	129	0	Echo Request
Permit	Any	A	1	0	No Route to Dst.
Permit	Any	A	2	0	Packet Too Big
Permit	Any	A	3	0	Time Exceeded— HL Exceeded
Permit	Any	A	4	0	Parameter Problem

Needed for Teredo traffic

Potential Additional ICMPv6

RFC 4890: Border Firewall Receive Policy

Action	Src	Dst	ICMPv6 Type	ICMPv6 Code	Name
Permit	Any	B	2	0	Packet too Big
Permit	Any	B	4	0	Parameter Problem
Permit	Any	B	130–132	0	Multicast Listener
Permit	Any	B	135/136	0	Neighbour Solicitation and Advertisement
Deny	Any	Any			

For locally generated by the device

Information Leak with Hop-Limit

- IPv6 hop-limit has identical semantics as IPv4 time-to-live
- Can be leveraged by design
 - To ensure packet is local iff hop-limit = 255
 - Notably used by Neighbour Discovery
- Can be leveraged by malevolent people
 - Guess the remote OS: Mac OS/X always set it to 64
 - Evade inspection: hackers send some IPv6 packets analysed by the IPS but further dropped by the network before reaching destination... Could evade some IPS
 - Threat: low and identical to IPv4

Preventing IPv6 Routing Attacks

Protocol Authentication

- BGP, ISIS, EIGRP no change:
 - An MD5 authentication of the routing update
- OSPFv3 has changed and pulled MD5 authentication from the protocol and instead rely on transport mode IPsec (for authentication and confidentiality)
 - But see draft-ietf-ospf-auth-trailer-ospfv3
- IPv6 routing attack best practices
 - Use traditional authentication mechanisms on BGP and IS-IS
 - Use IPsec to secure protocols such as OSPFv3

OSPF or EIGRP Authentication

For Your
Reference

```
interface Ethernet0/0
  ipv6 ospf 1 area 0
  ipv6 ospf authentication ipsec spi 500 md5 1234567890ABCDEF1234567890ABCDEF
```

```
interface Ethernet0/0
  ipv6 authentication mode eigrp 100 md5
  ipv6 authentication key-chain eigrp 100 MYCHAIN
```

```
key chain MYCHAIN
  key 1
  key-string 1234567890ABCDEF1234567890ABCDEF
  accept-lifetime local 12:00:00 Dec 31 2011 12:00:00 Jan 1 2012
  send-lifetime local 00:00:00 Jan 1 2012 23:59:59 Dec 31 2013
```

No crypto maps, no ISAKMP: transport mode with static session keys

IPv6 Attacks with Strong IPv4 Similarities

- **Sniffing**
 - IPv6 is no more or less likely to fall victim to a sniffing attack than IPv4
- **Application layer attacks**
 - The majority of vulnerabilities on the Internet today are at the application layer, something that IPSec will do nothing to prevent
- **Rogue devices**
 - Rogue devices will be as easy to insert into an IPv6 network as in IPv4
- **Man-in-the-Middle Attacks (MITM)**
 - Without strong mutual authentication, any attacks utilising MITM will have the same likelihood in IPv6 as in IPv4
- **Flooding**
 - Flooding attacks are identical between IPv4 and IPv6

IPv6 Stack Vulnerabilities

- IPv6 stacks were new and could be buggy
- Some examples

CVE-2011-2393	Feb 2012	FreeBSD OpenBSD NetBSD and others	Local users DoS with RA flooding
CVE-2010-4563	Feb 2012	Linux	Remote detection of promiscuous mode
CVE-2011-2059	Oct 2011	IOS	Remote OS detection with ICMP + HbH
CVE-2008-1576	Jun 2008	Apple Mac OS X	Buffer overflow in Mail over IPv6
CVE-2010-4669	Jan 2011	Microsoft	Flood of forged RA DoS

Source: <http://cve.mitre.org/cve/>

Specific IPv6 Issues

IPv6 Privacy Extensions (RFC 4941)

- Temporary addresses for IPv6 host client application, e.g. web browser
 - Inhibit device/user tracking
 - Random 64 bit interface ID, then run Duplicate Address Detection before using it
 - Rate of change based on local policy
- Enabled by default in Windows, Android, iOS 4.3, Mac OS/X 10.7

Recommendation: Use Privacy Extensions for External Communication but not for Internal Networks (Troubleshooting and Attack Trace Back)

Disabling Privacy Extension

For Your
Reference

- Microsoft Windows
 - Deploy a Group Policy Object (GPO)
 - Or

```
netsh interface ipv6 set global randomizeidentifiers=disabled
netsh interface ipv6 set global randomizeidentifiers=disabled store=persistent
netsh interface ipv6 set privacy state=disabled store=persistent
```

- Alternatively disabling stateless auto-configuration and force DHCPv6
 - Send Router Advertisements with
 - all prefixes with A-bit set to 0 (disable SLAAC)
 - M-bit set to 1 to force stateful DHCPv6
 - Use DHCP to a specific pool + ingress ACL allowing only this pool

```
interface fastEthernet 0/0
  ipv6 nd prefix default no-autoconfig
  ipv6 dhcp server . . . (or relay)
  ipv6 nd managed-config-flag
```

IPv6 Header Manipulation

- Unlimited size of header chain (spec-wise) can make filtering difficult
- Potential DoS with poor IPv6 stack implementations
 - More boundary conditions to exploit
 - Can I overrun buffers with a lot of extension headers?
 - Mitigation: a firewall such as ASA which can filter on headers

⊕ Frame 1 (423 bytes on wire, 423 bytes captured)

⊕ Raw packet data

⊕ Internet Protocol Version 6

⊕ Hop-by-hop Option Header

⊕ Destination Option Header

⊕ Routing Header, Type 0

⊕ Hop-by-hop Option Header

⊕ Destination Option Header

⊕ Routing Header, Type 0

⊕ Destination Option Header

⊕ Routing Header, Type 0

⊕ Transmission Control Protocol, Src Port: 1024 (1024), Dst Port: bgp (179), Seq: 0, Ack: 0, Len: 51

⊕ Border Gateway Protocol

Perfectly Valid IPv6 Packet According to the Sniffer

Header Should Only Appear Once

Destination Header Which Should Occur at Most Twice

Destination Options Header Should Be the Last

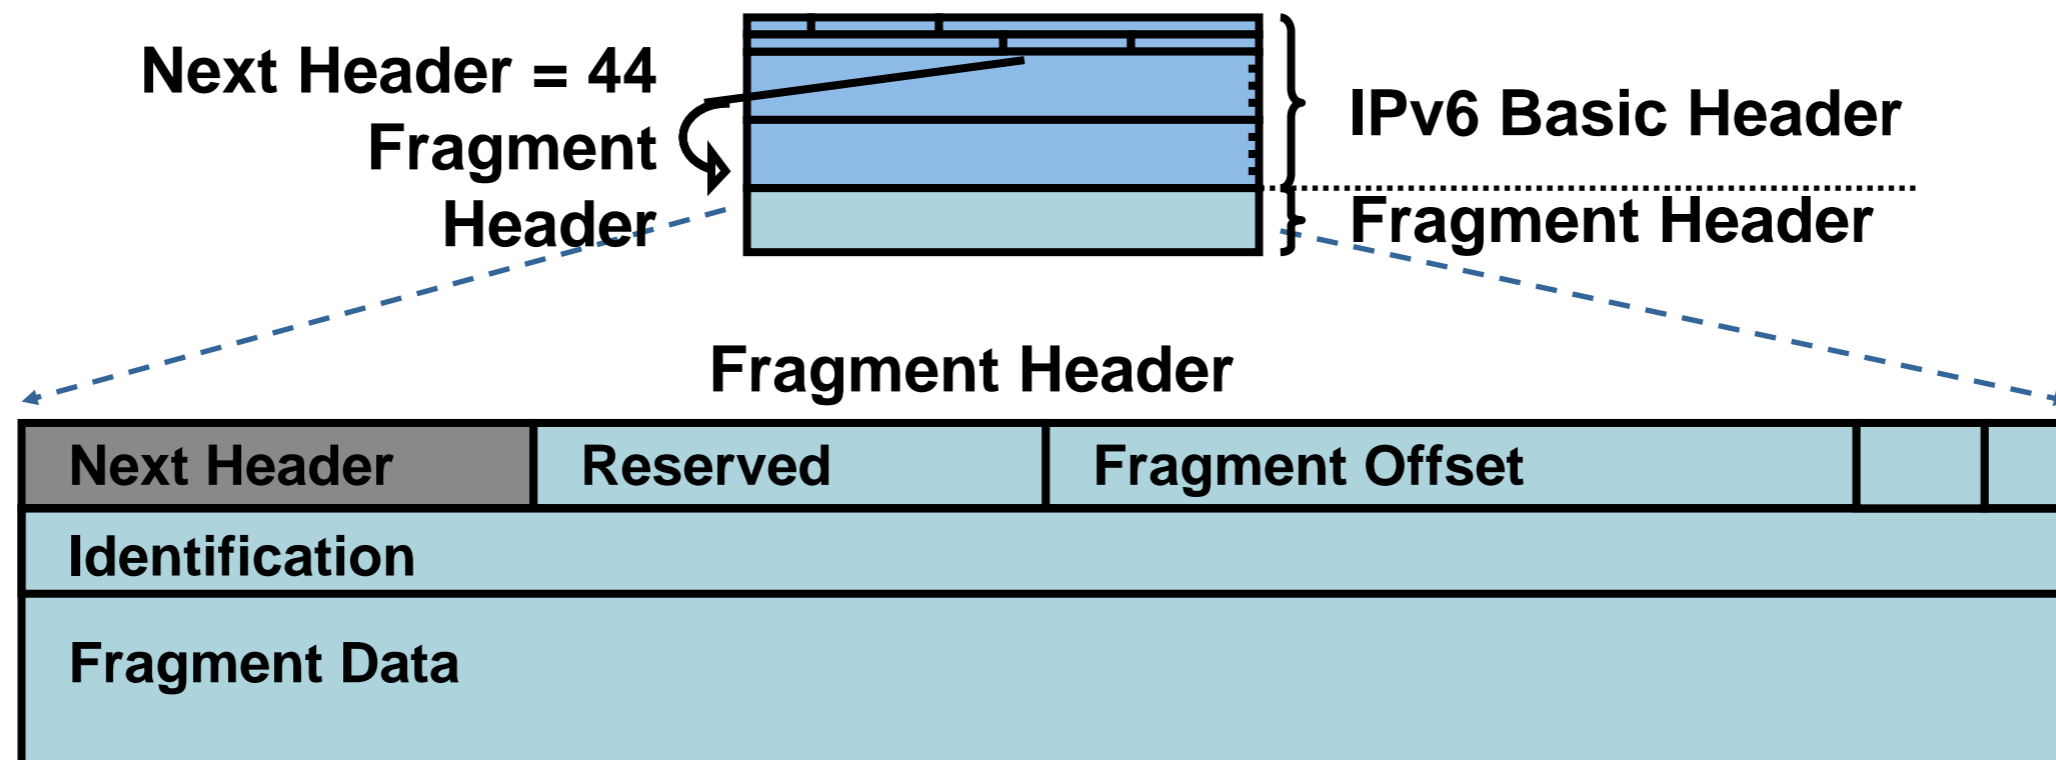

http://www.cisco.com/en/US/technologies/tk648/tk872/technologies_white_paper0900aecd8054d37d.html

Parsing the Extension Header Chain

- Finding the layer 4 information is not trivial in IPv6
 - Skip all known extension header
 - Until either known layer 4 header found => **MATCH**
 - Or unknown extension header/layer 4 header found... => **NO MATCH**

Fragment Header: IPv6

- In IPv6 fragmentation is done **only** by the end system
 - Tunnel end-points are end systems => Fragmentation / re-assembly can happen inside the network
- Reassembly done by end system like in IPv4
- RFC 5722: overlapping fragments => **MUST** drop the packet. Most OS implement it in 2012
- Attackers can still fragment in intermediate system on purpose
- ==> a great obfuscation tool

Parsing the Extension Header Chain

Fragmentation Matters!

- Extension headers chain can be so large than it must be fragmented!
- RFC 3128 is not applicable to IPv6
- Layer 4 information could be in 2nd fragment

Layer 4 header is
in 2nd fragment

Parsing the Extension Header Chain

Fragments and Stateless Filters

- RFC 3128 is not applicable to IPv6
- Layer 4 information could be in 2nd fragment
- But, stateless firewalls could not find it if a previous extension header is fragmented

Layer 4 header is in 2nd fragment,
Stateless filters have no clue
where to find it!

IPv6 Fragmentation & IOS ACL

Fragment Keyword

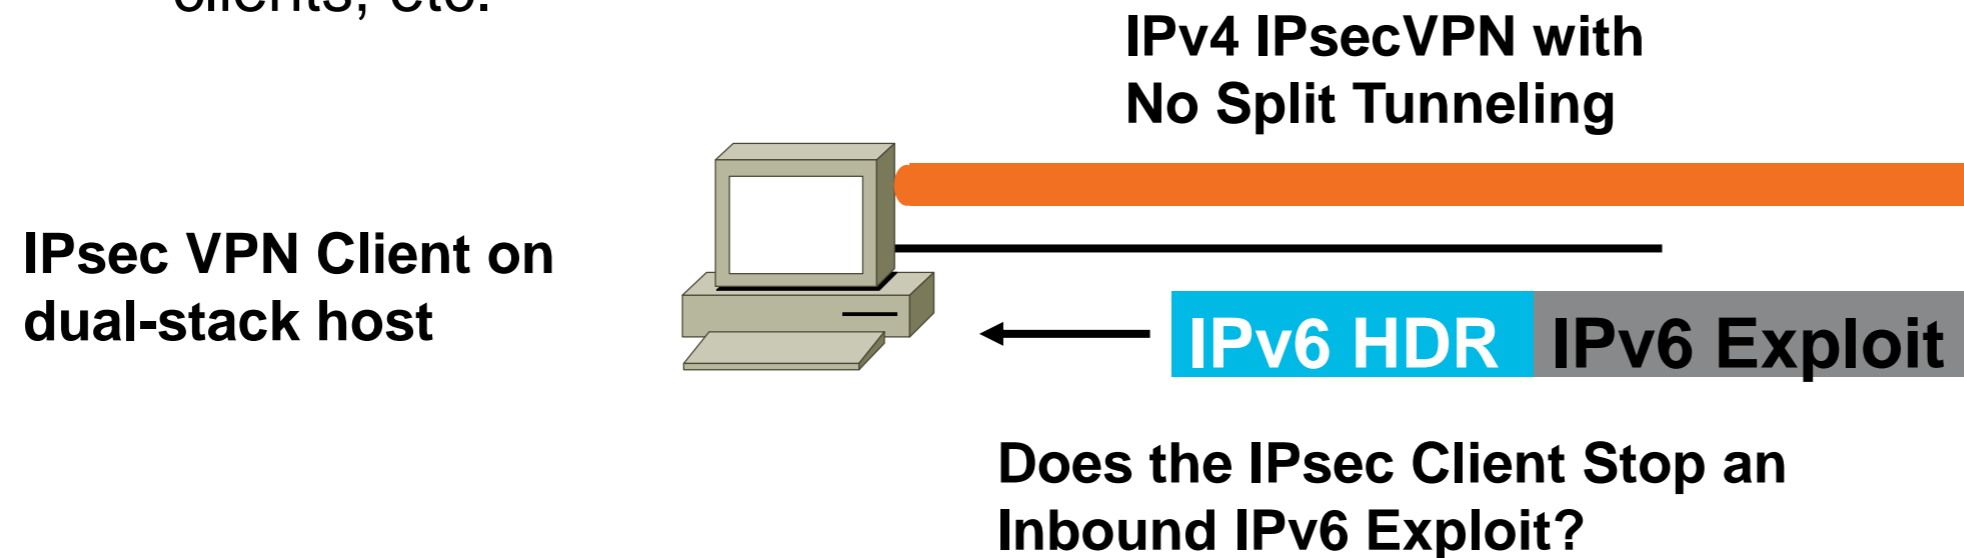

- This makes matching against the first fragment **non-deterministic**:
 - layer 4 header might not be there but in a later fragment
 - ⇒ Need for stateful inspection
- **fragment** keyword matches
 - Non-initial fragments (same as IPv4)
- **underterminated-transport** keyword does not match
 - TCP/UDP/SCTP and ports are in the fragment
 - ICMP and type and code are in the fragment
 - Everything else matches (including OSPFv3, ...)
 - Only for deny ACE

IPv4 to IPv6 Transition Challenges

- 16+ methods, possibly in combination
- Dual stack
 - Consider security for both protocols
 - Cross v4/v6 abuse
 - Resiliency (shared resources)
- Tunnels
 - Bypass firewalls (protocol 41 or UDP)
 - Can cause asymmetric traffic (hence breaking stateful firewalls)

Dual Stack Host Considerations

- Host security on a dual-stack device
 - Applications can be subject to attack on both IPv6 and IPv4
 - **Fate sharing**: as secure as the least secure stack...
- Host security controls should block and inspect traffic from both IP versions
 - Host intrusion prevention, personal firewalls, VPN clients, etc.

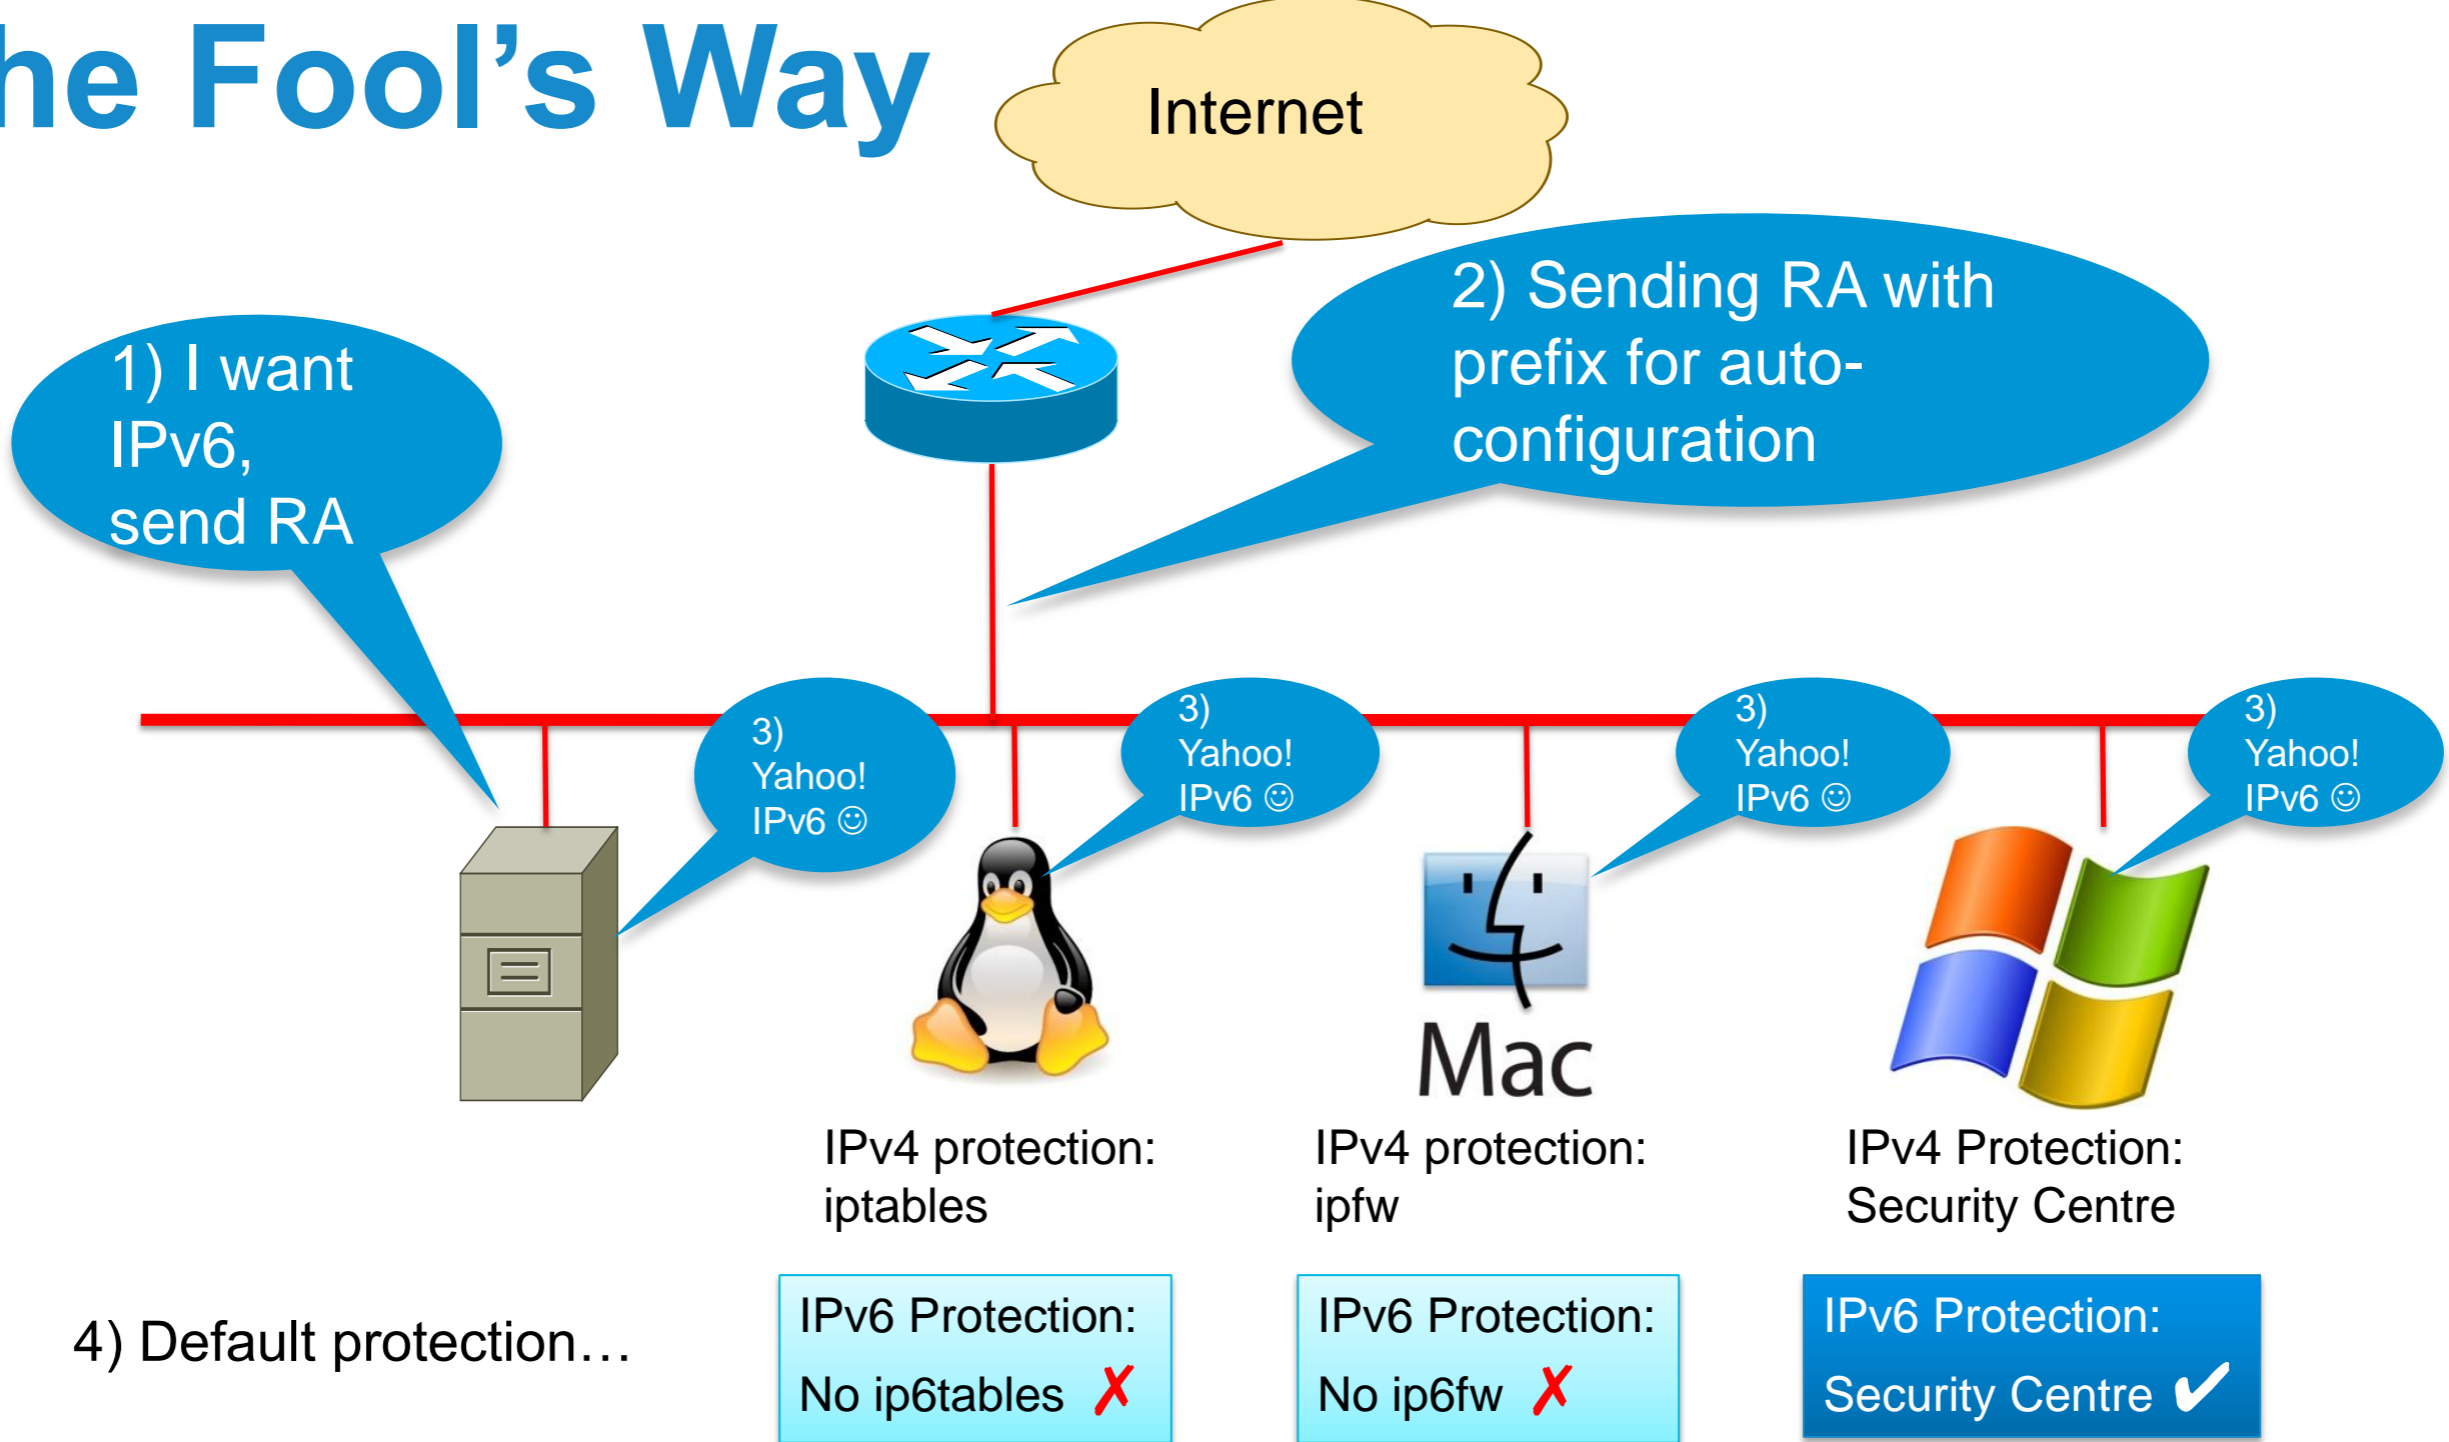

Dual Stack with Enabled IPv6 by Default

- Your host:
 - IPv4 is protected by your favorite personal firewall...
 - IPv6 is enabled by default (Vista, Linux, Mac OS/X, ...)
- Your network:
 - Does not run IPv6
- Your assumption:
 - I'm safe
- Reality
 - You are **not** safe
 - Attacker sends Router Advertisements
 - Your host configures silently to IPv6
 - You are now under IPv6 attack
- => **Probably time to think about IPv6 in your network**

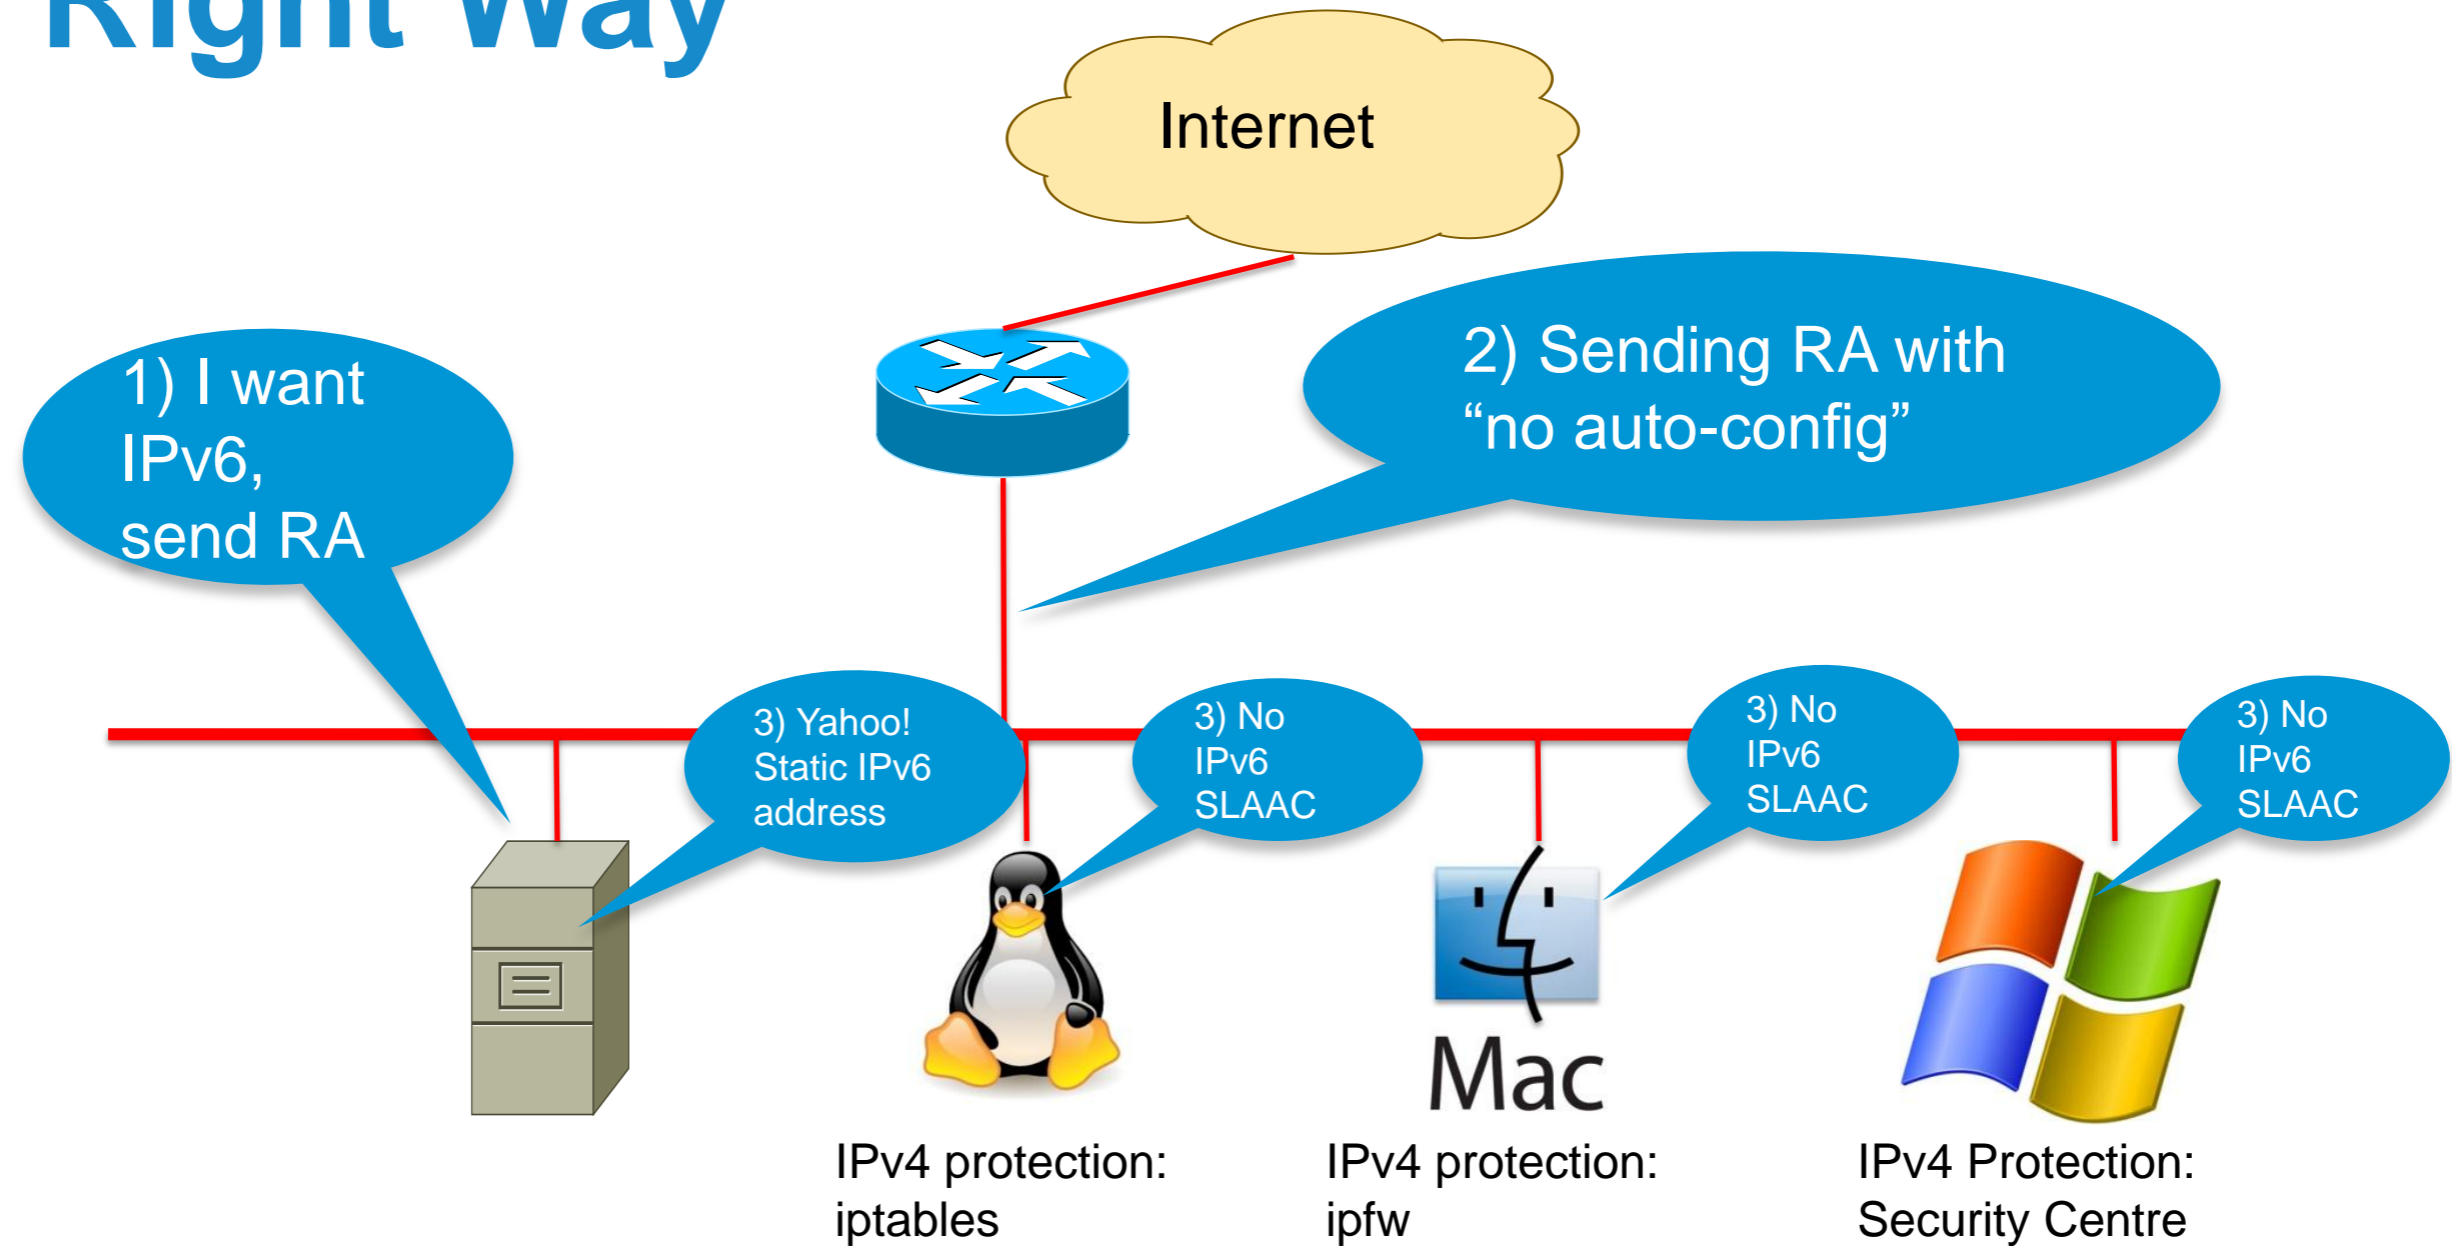

Enabling IPv6 in the IPv4 Data Centre

The Fool's Way

Enabling IPv6 in the IPv4 Data Centre

The Right Way

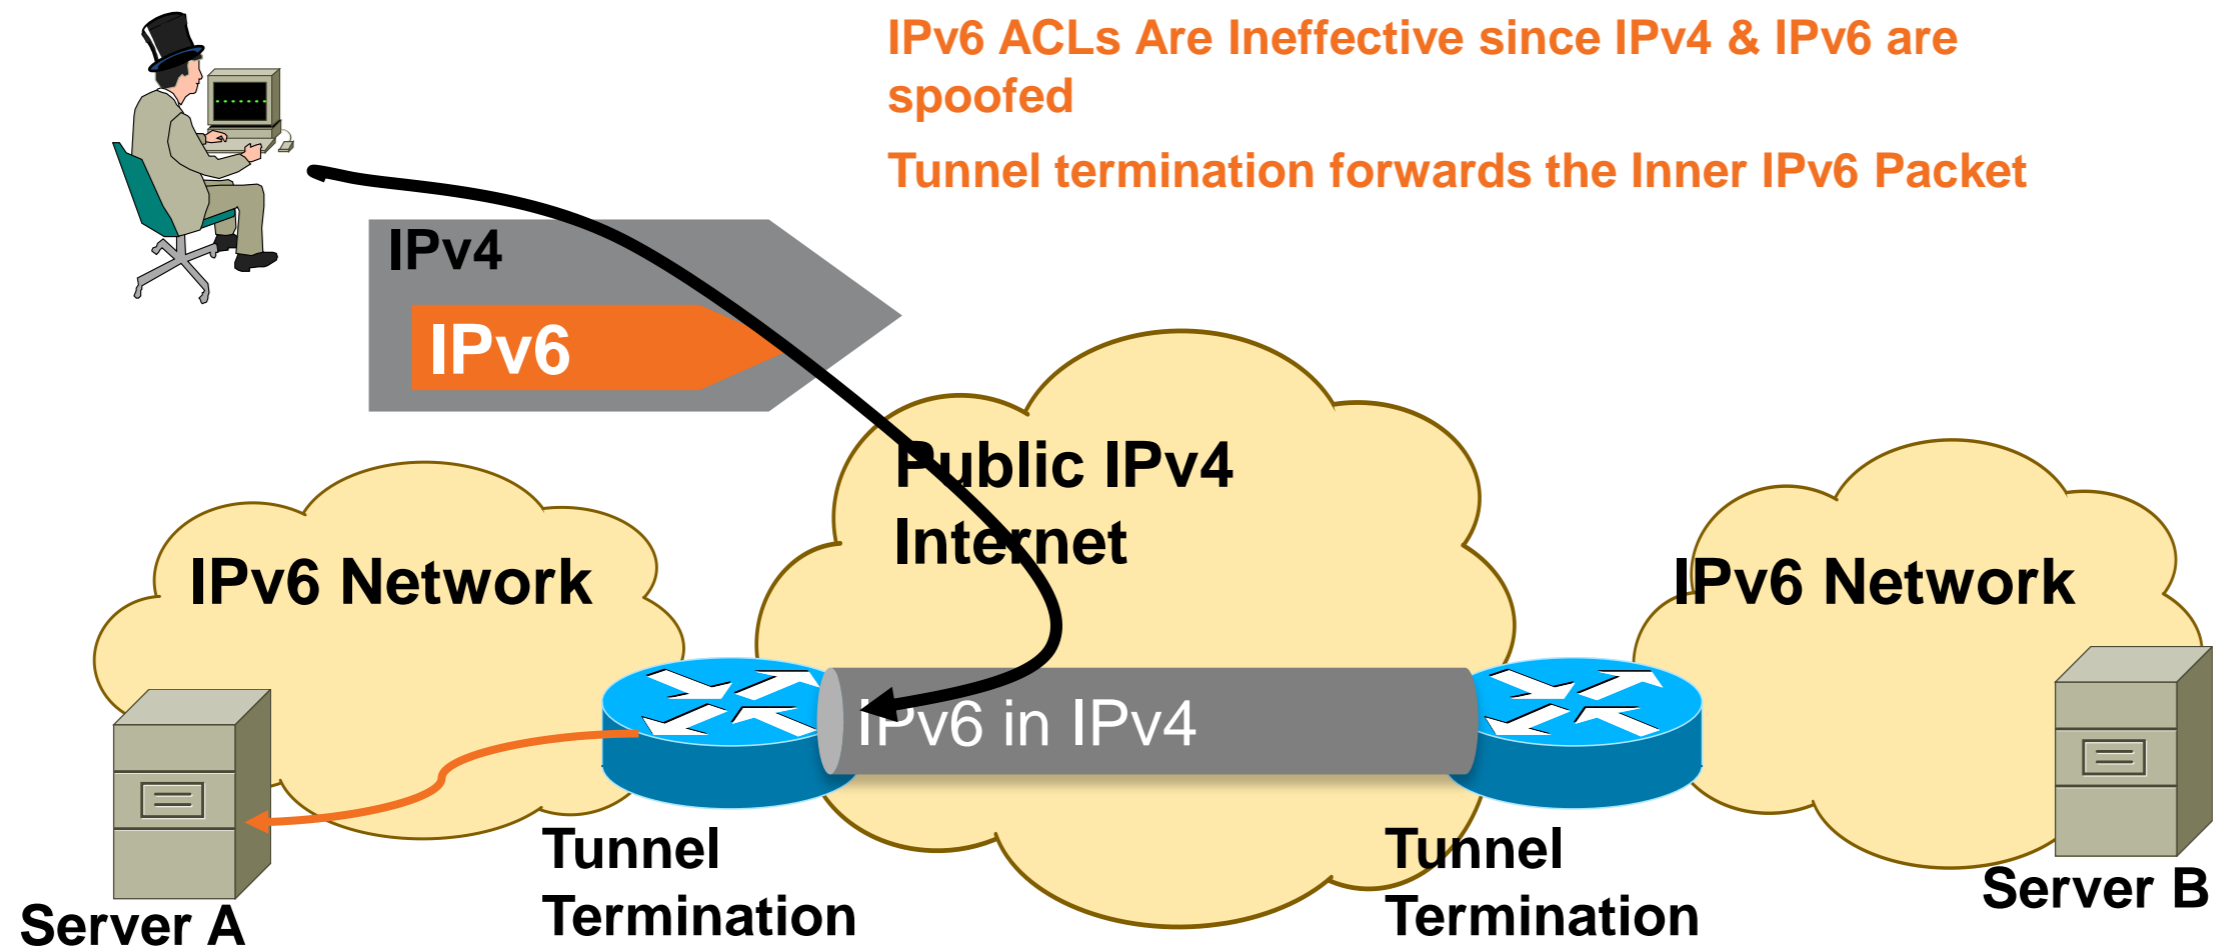

IPv6 Tunneling Summary

- RFC 1933/2893 configured and automatic tunnels
- RFC 2401 IPSec tunnel
- RFC 2473 IPv6 generic packet tunnel
- RFC 2529 6over4 tunnel
- RFC 3056 6to4 tunnel
- RFC 5214 ISATAP tunnel
- MobileIPv6 (uses RFC2473)
- RFC 4380 Teredo tunnels
- RFC 5569 6RD
- Only allow authorised endpoints to establish tunnels
- Static tunnels are deemed as “more secure,” but less scalable
- Automatic tunnelling mechanisms are susceptible to packet forgery and DoS attacks
- These tools have the **same risk** as IPv4, just new avenues of exploitation
- Automatic IPv6 over IPv4 tunnels could be secured by IPv4 IPSec
- And more to come to transport IPv4 over IPv6...

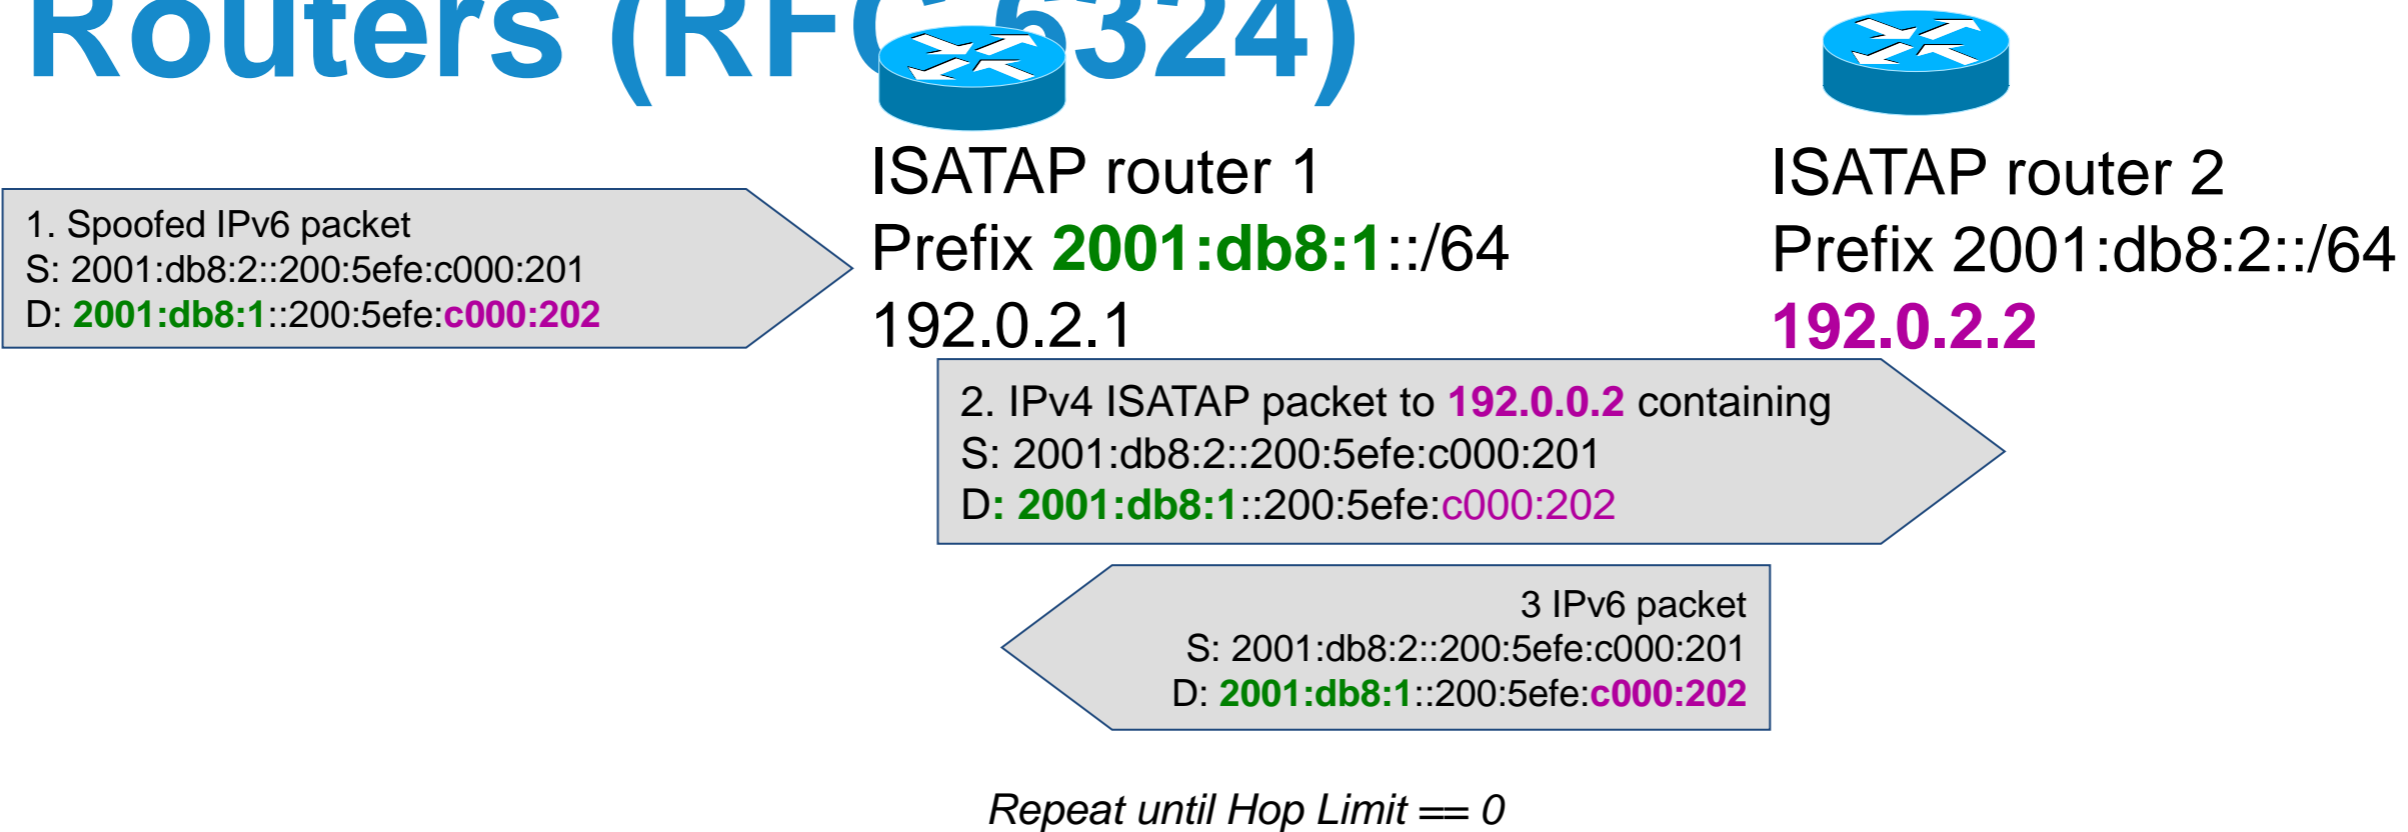

L3-L4 Spoofing in IPv6

When Using IPv6 over IPv4 Tunnels

- Most IPv4/IPv6 transition mechanisms have no authentication built in
- => an IPv4 attacker can inject traffic if spoofing on IPv4 and IPv6 addresses

Looping Attack Between 2 ISATAP Routers (RFC 6324)

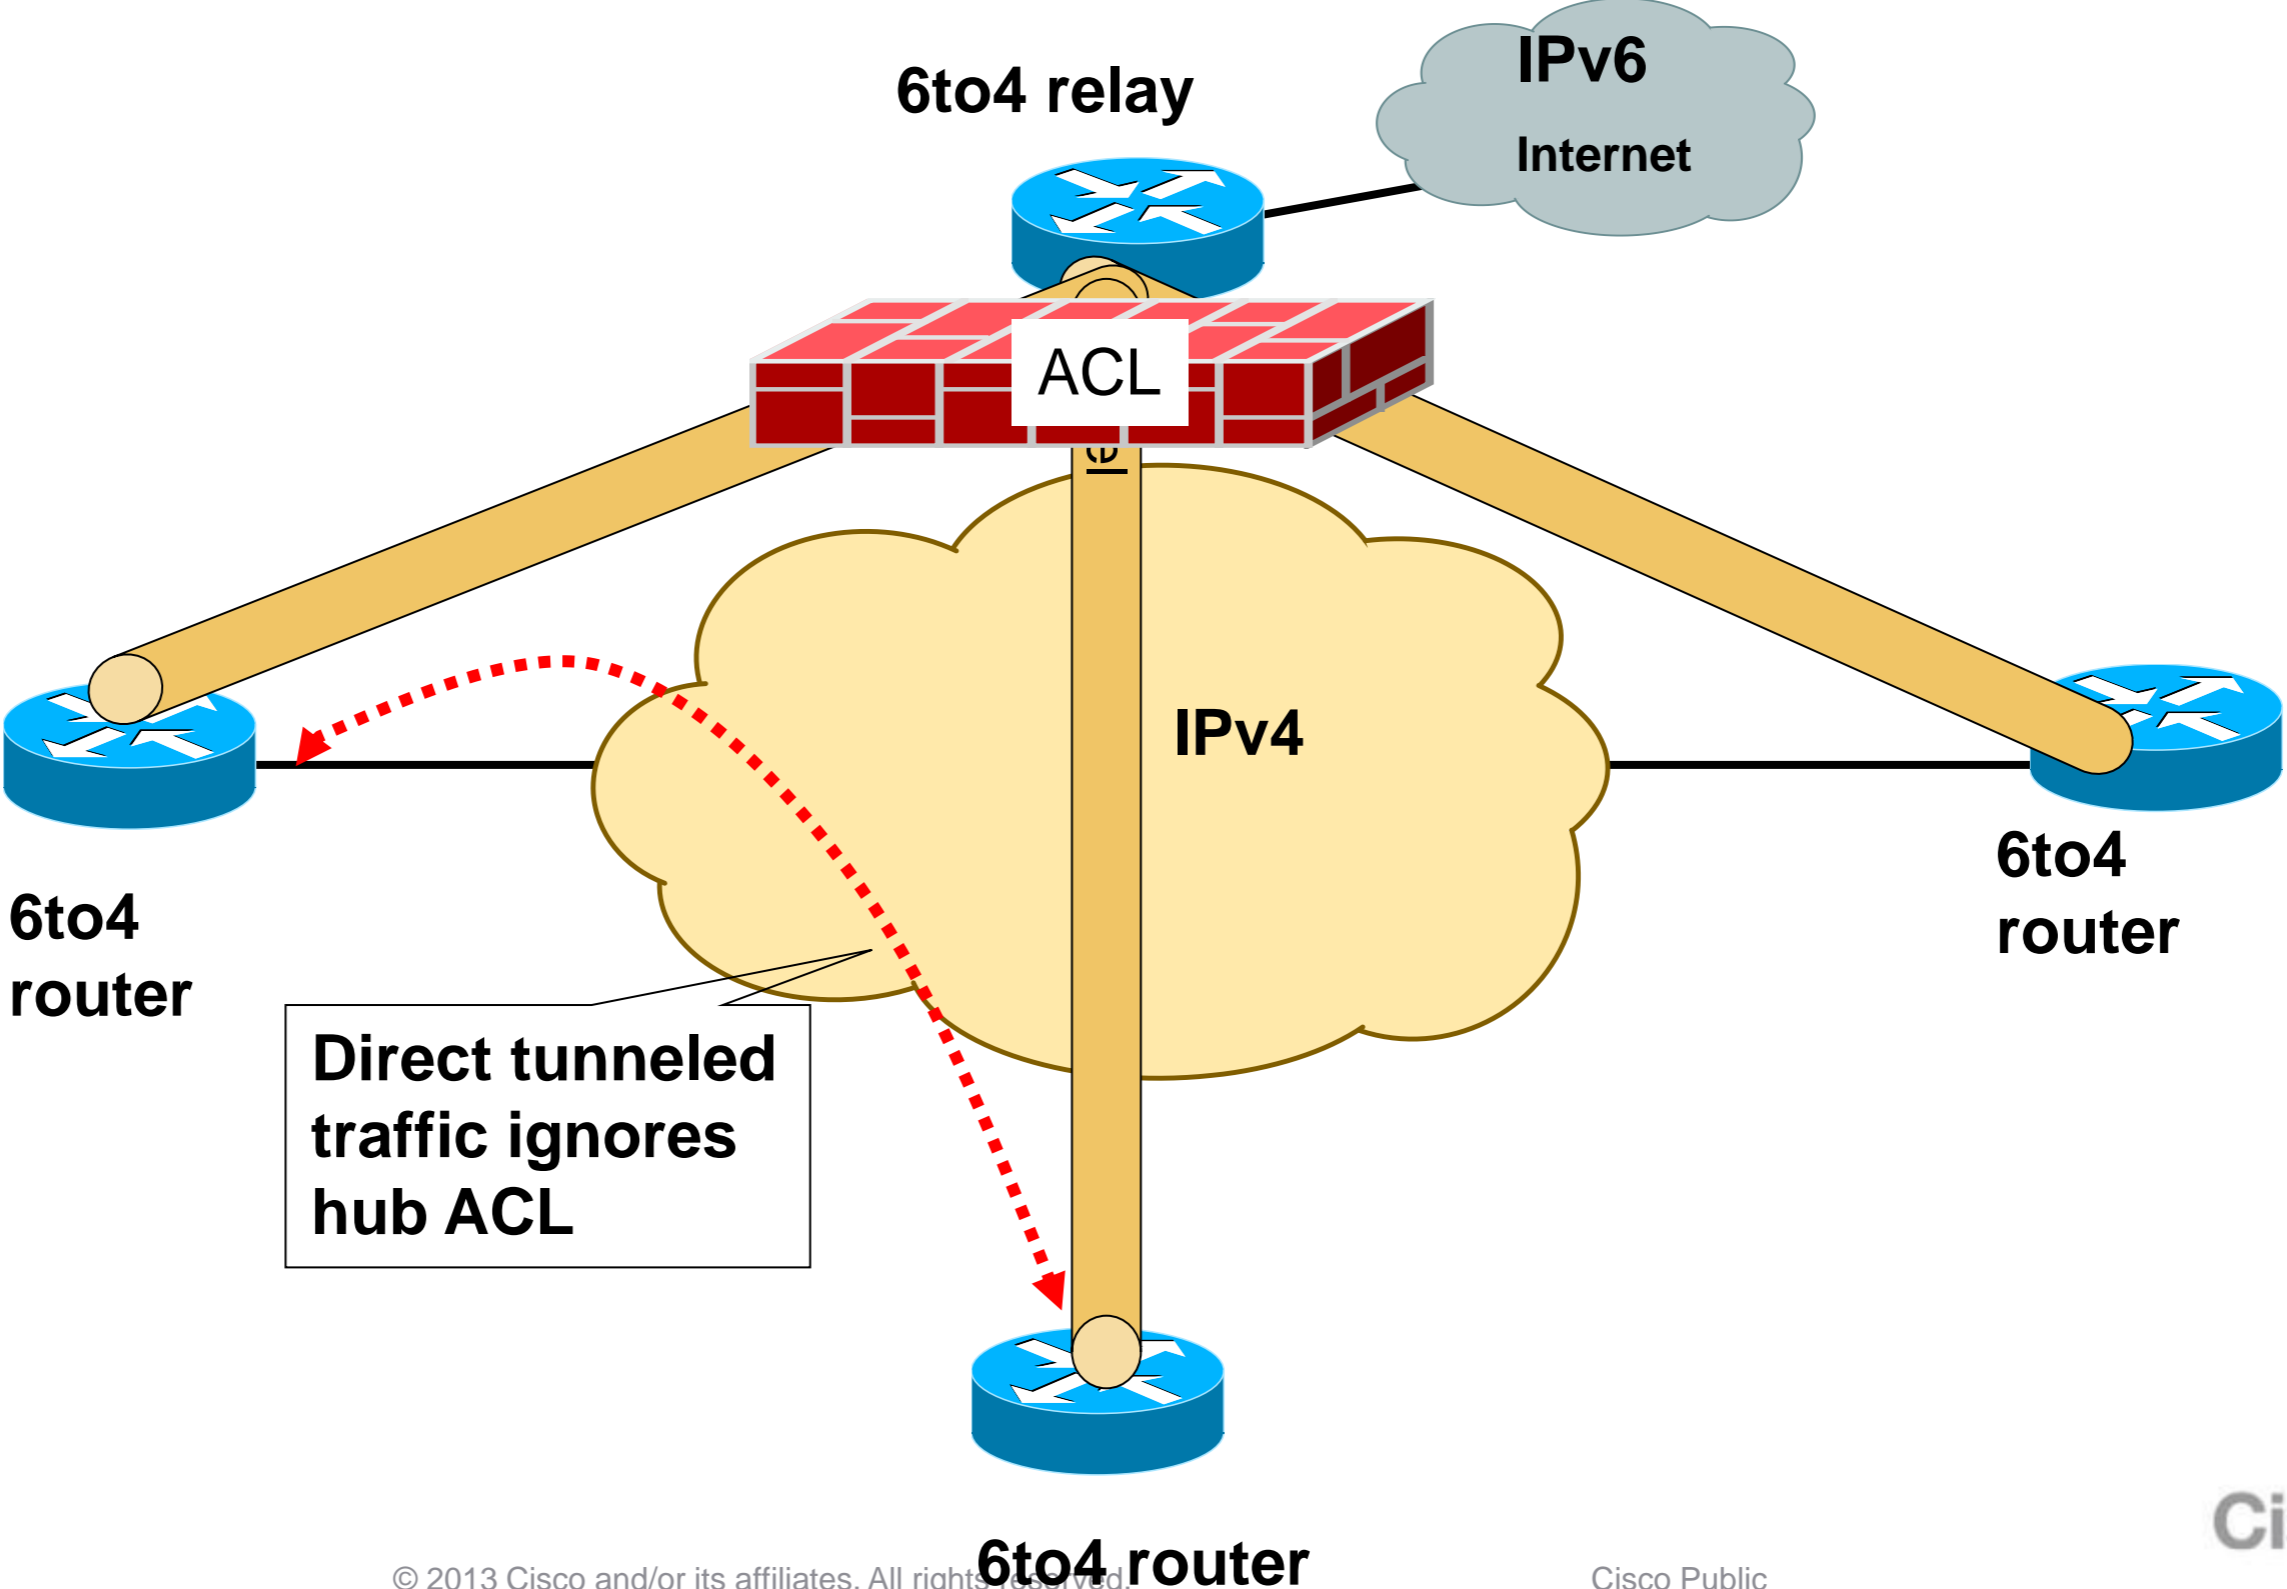

- Root cause
 - ISATAP routers ignore each other
- ISATAP router:
 - accepts native IPv6 packets
 - forwards it inside its ISATAP tunnel
 - Other ISATAP router decaps and forward as native IPv6

Mitigation:

- IPv6 anti-spoofing everywhere
- ACL on ISATAP routers accepting IPv4 from valid clients only
- Within an enterprise, block IPv4 ISATAP traffic between ISATAP routers
- Within an enterprise block IPv6 packets between ISATAP routers

ISATAP/6to4 Tunnels Bypass ACL

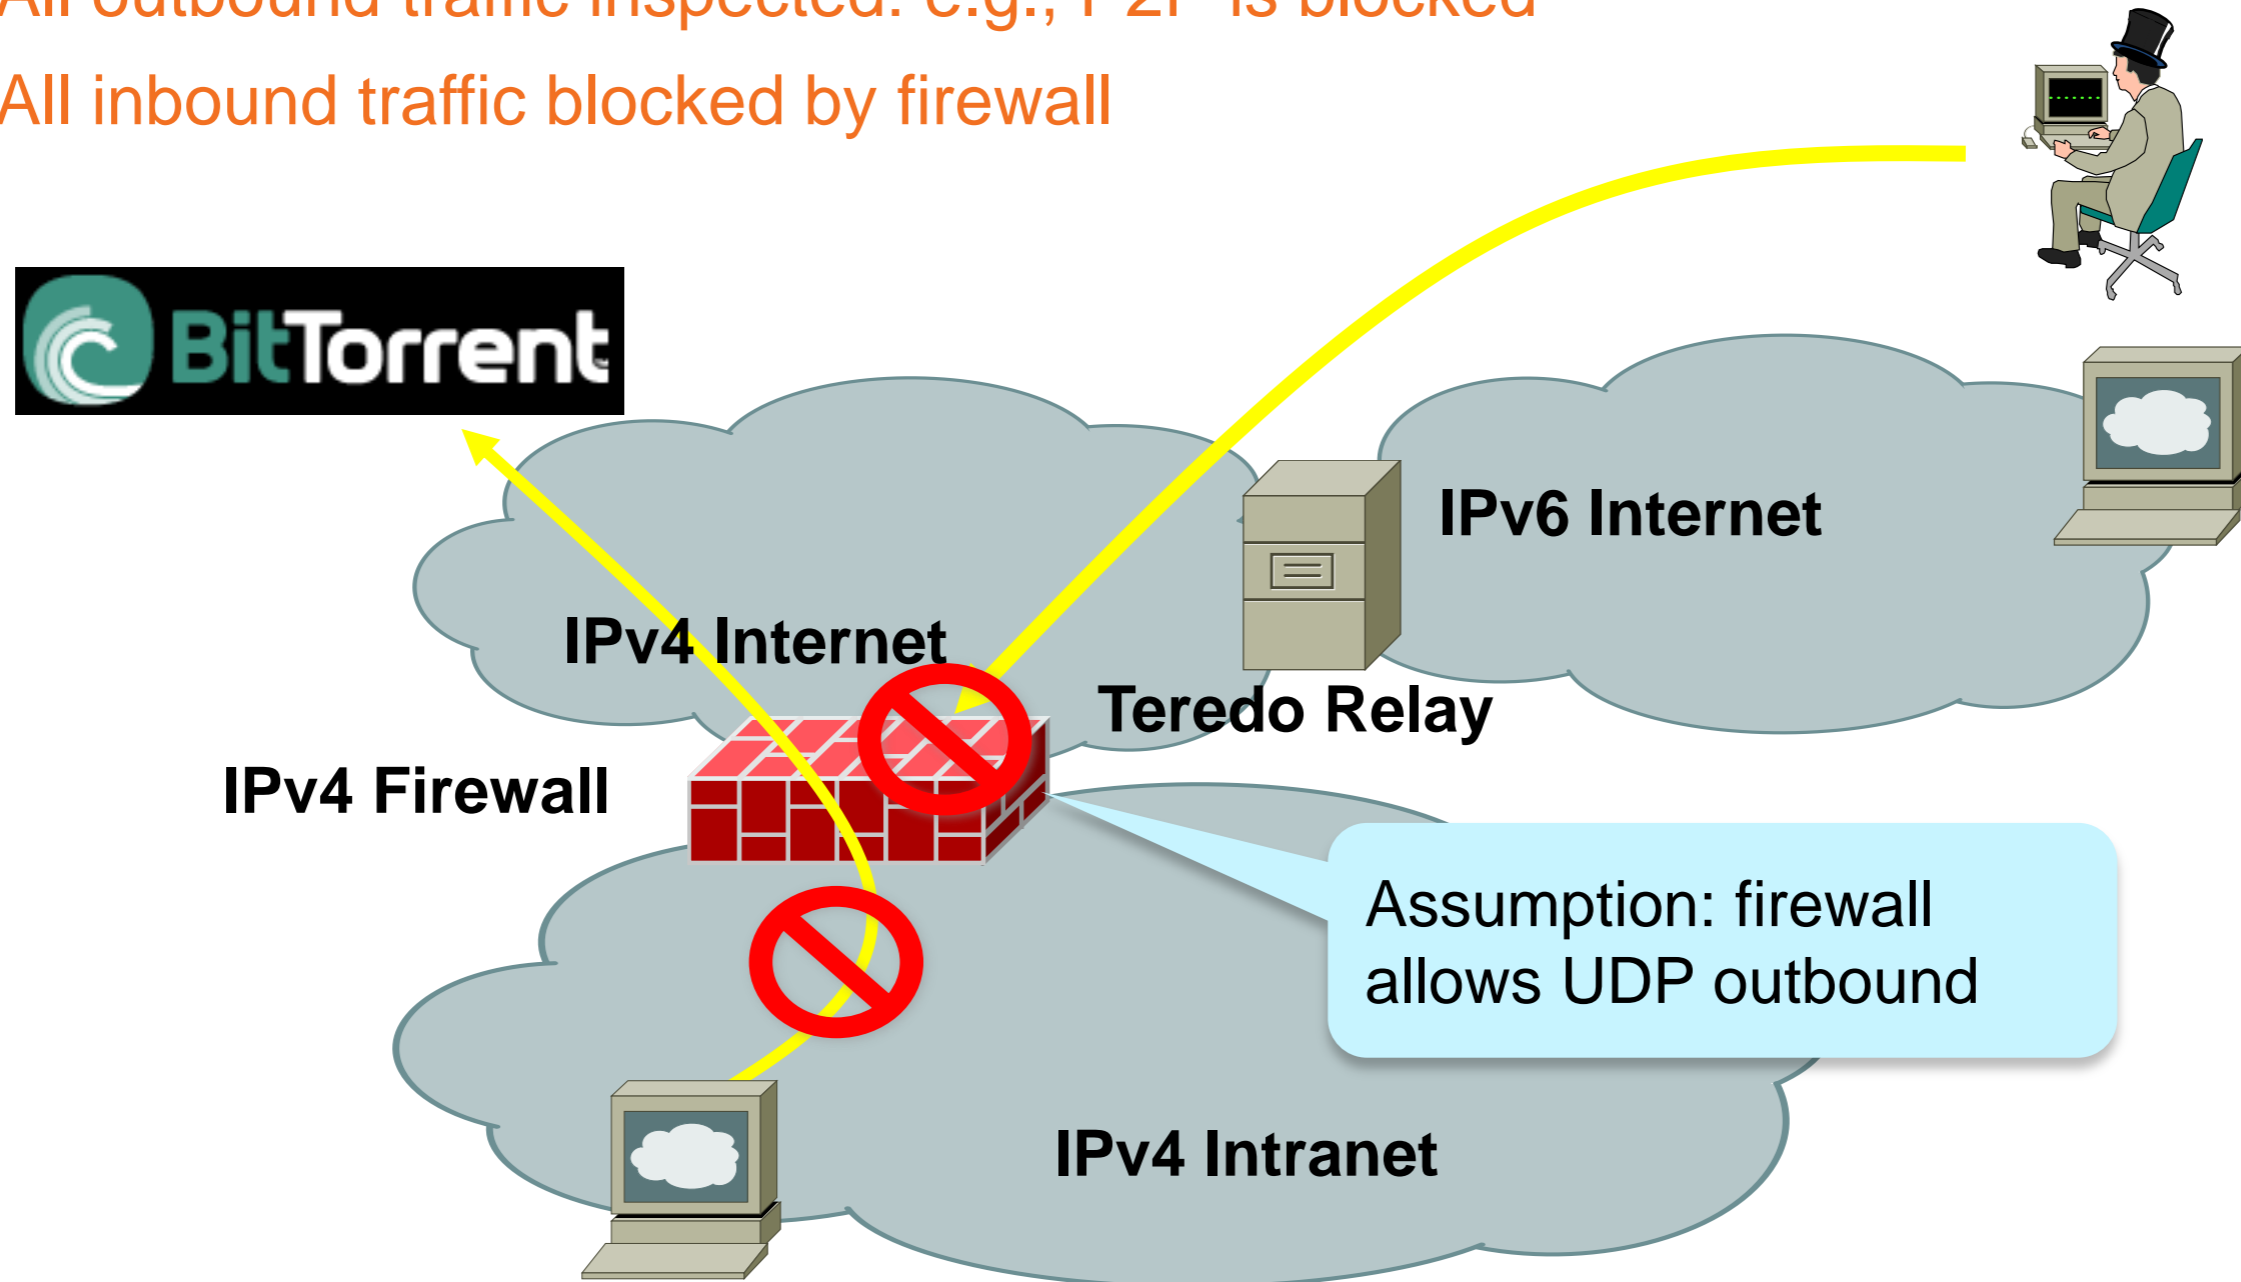

TEREDO?

- **Teredo navalis**
 - A shipworm drilling holes in boat hulls
- **Teredo Microsoftis**
 - IPv6 in IPv4 punching holes in NAT devices

Teredo Tunnels (1/3)

Without Teredo: Controls Are in Place

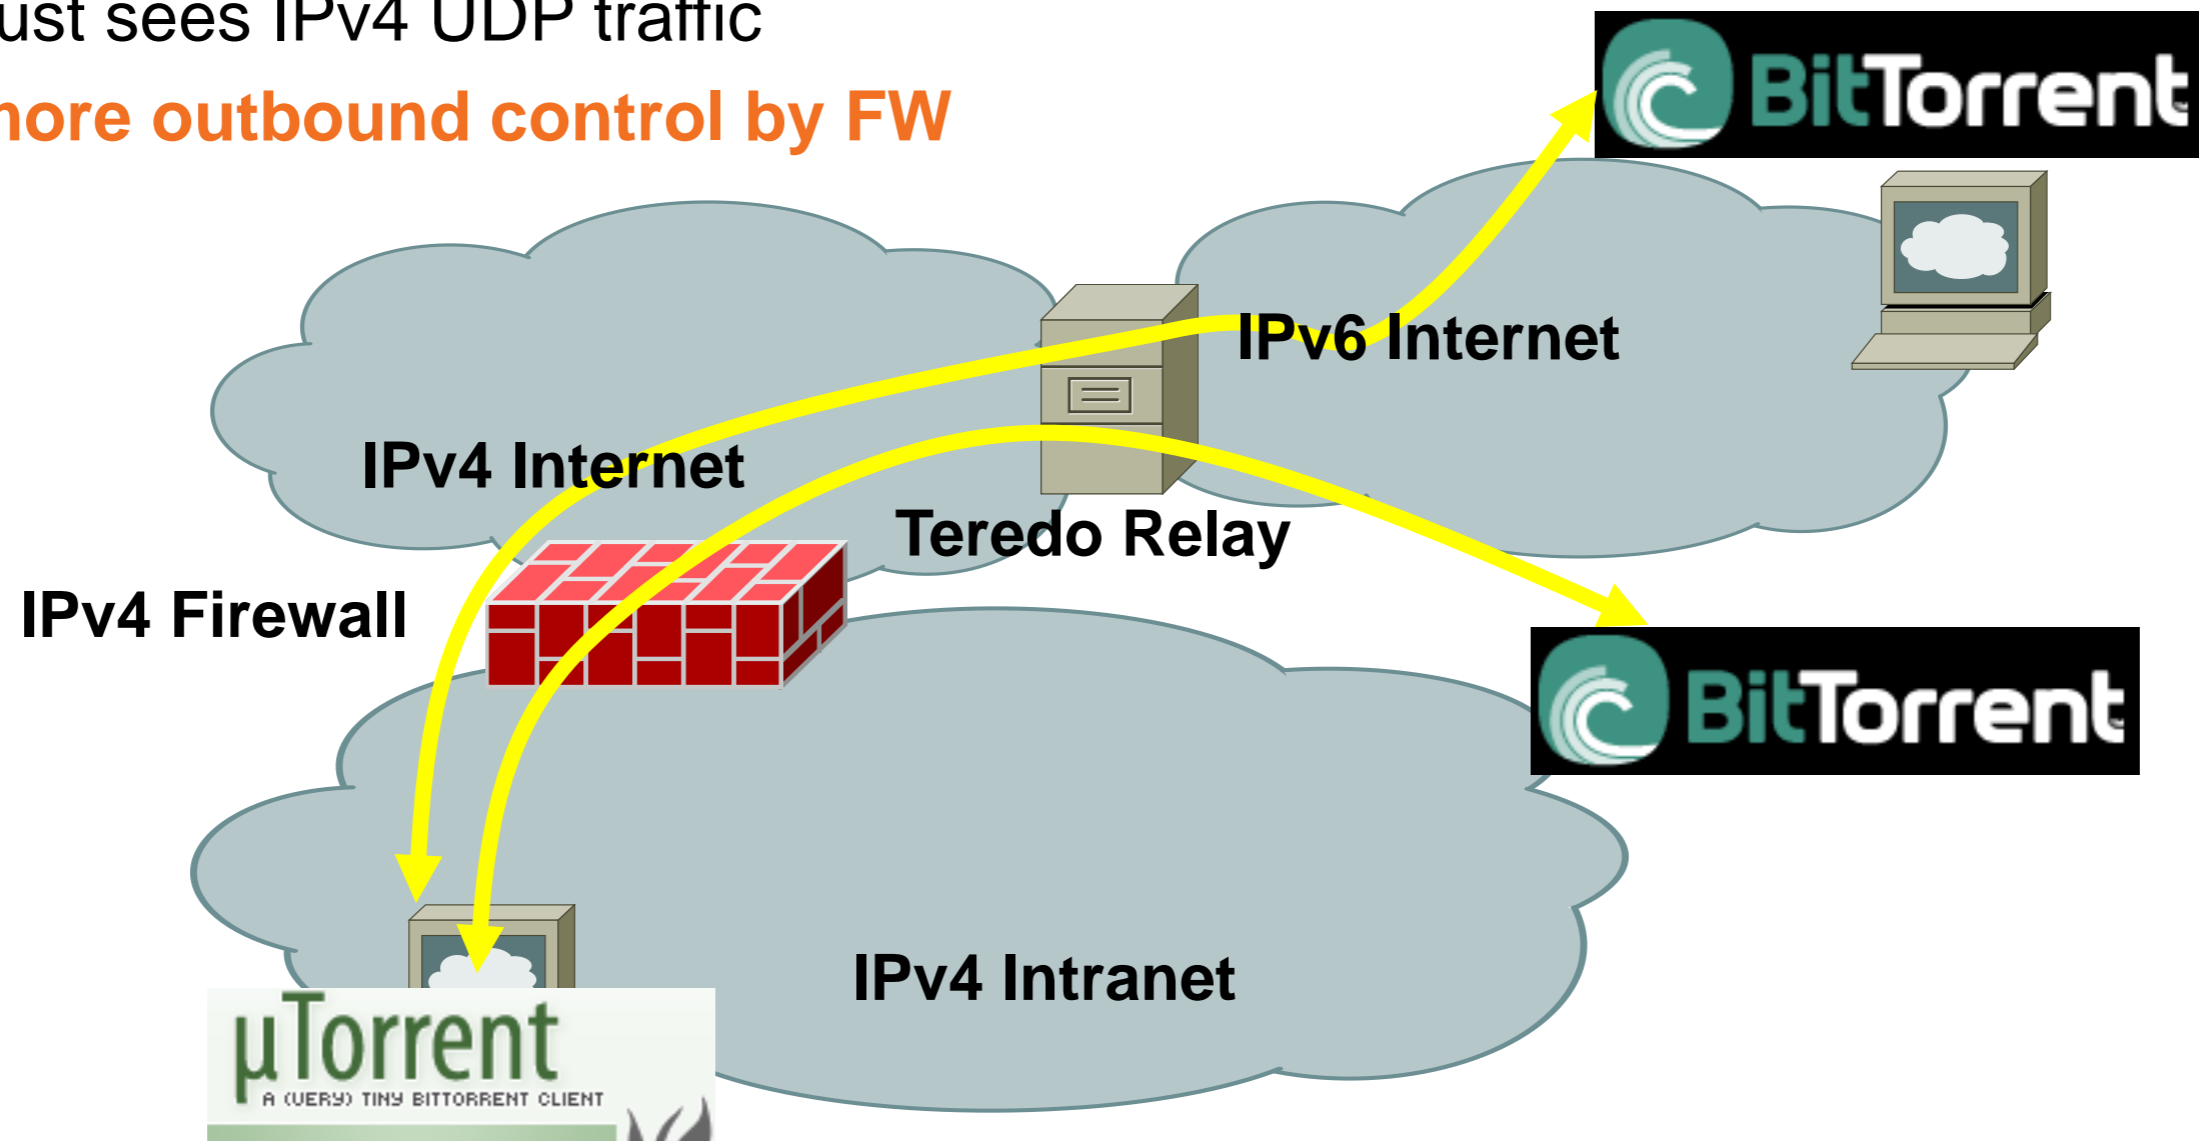

- All outbound traffic inspected: e.g., P2P is blocked
- All inbound traffic blocked by firewall

Teredo Tunnels (2/3)

No More Outbound Control

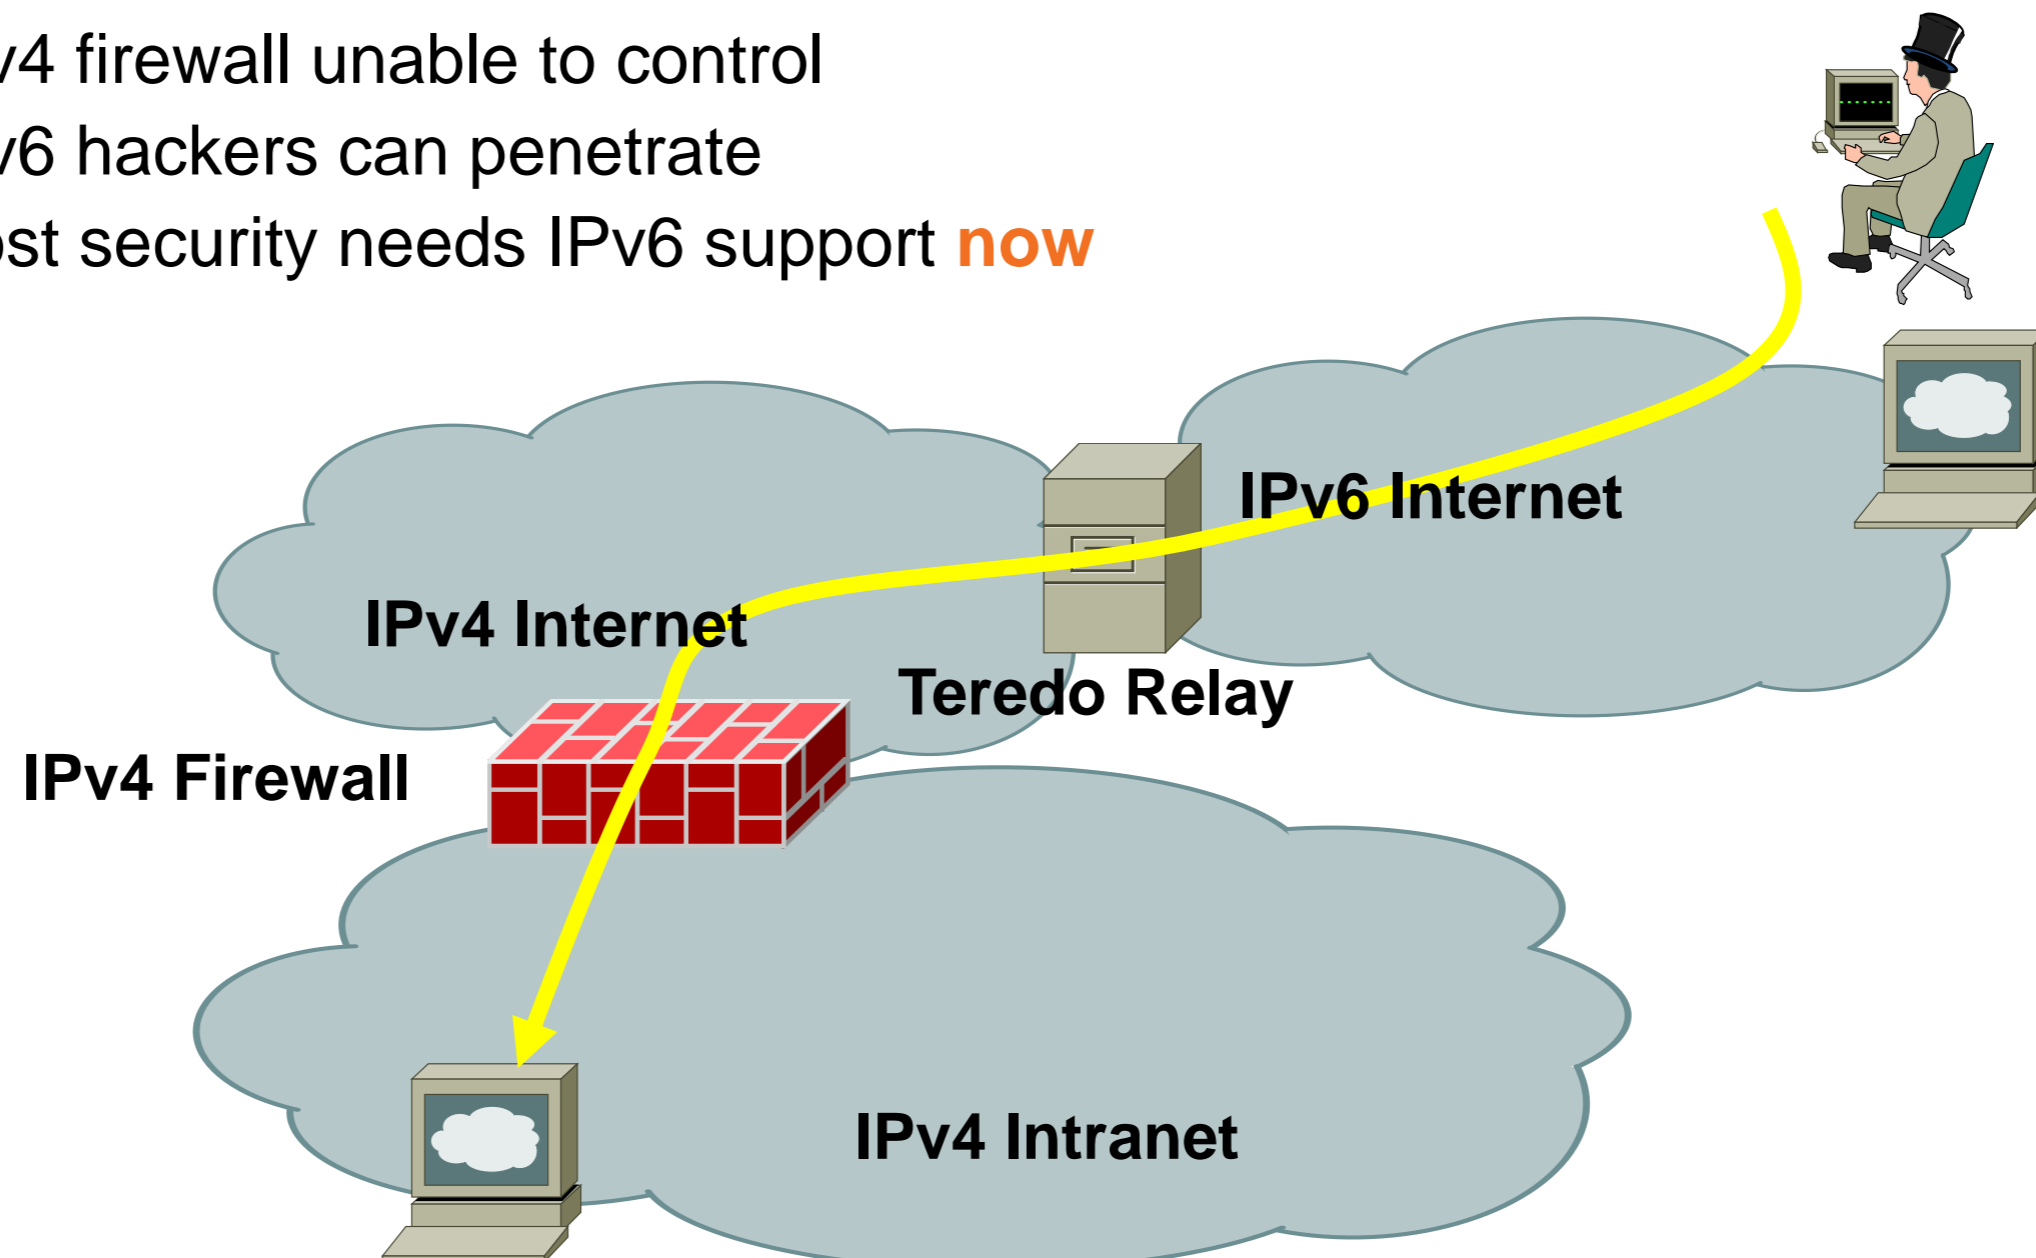

- Internal users wants to get P2P over IPv6
- Configure the Teredo tunnel (already enabled by default!)
- FW just sees IPv4 UDP traffic
- **No more outbound control by FW**

Teredo Tunnels (3/3)

No More Outbound Control

- **Inbound** connections are allowed
- IPv4 firewall unable to control
- IPv6 hackers can penetrate
- Host security needs IPv6 support **now**

Is it Real?

May be uTorrent 1.8 (Released Aug 08)

2a01:e35:2eb5:2820:221:e9ff:fee5:a32d	µTorrent Mac 0.9
2a01:e35:2f24:7990:ad15:fc01:6907:4b07	µTorrent 1.8.2
2a01:e35:8a17:4c70:6c5b:3560:b117:49a5	BitTorrent 6.1.2
2a01:e35:8a85:e8f0:d514:7e66:7db:81c8	µTorrent 1.8.2
2a01:e35:8b43:4c80:e516:ca2:f9af:beec	µTorrent 1.8.2

The screenshot shows the 'Preferences' dialog box for uTorrent, specifically the 'General' tab. The 'Language' is set to '(System Default)'. Under 'Windows Integration', the 'Check association on startup' checkbox is checked, and the 'Start µTorrent on system startup' checkbox is unchecked. The 'Install IPv6/Teredo' button is circled in red. Other options include 'Associate with .torrent files', 'Associate with .btsearch files', and 'Associate with magnet URIs'. The 'Privacy' section has 'Check for updates automatically' and 'Send anonymous information when checking for updates' checked. The 'When Downloading' section has 'Prevent standby if there are active torrents' checked. The 'Boss-Key' is set to 'None'. Buttons for 'OK', 'Cancel', and 'Apply' are at the bottom.

Note: on Windows Teredo is:
-Disabled when firewall is disabled
-Disabled when PC is part of Active Directory domain
-Else enabled
-User can override this protection

Can We Block Rogue Tunnels?

For Your
Reference

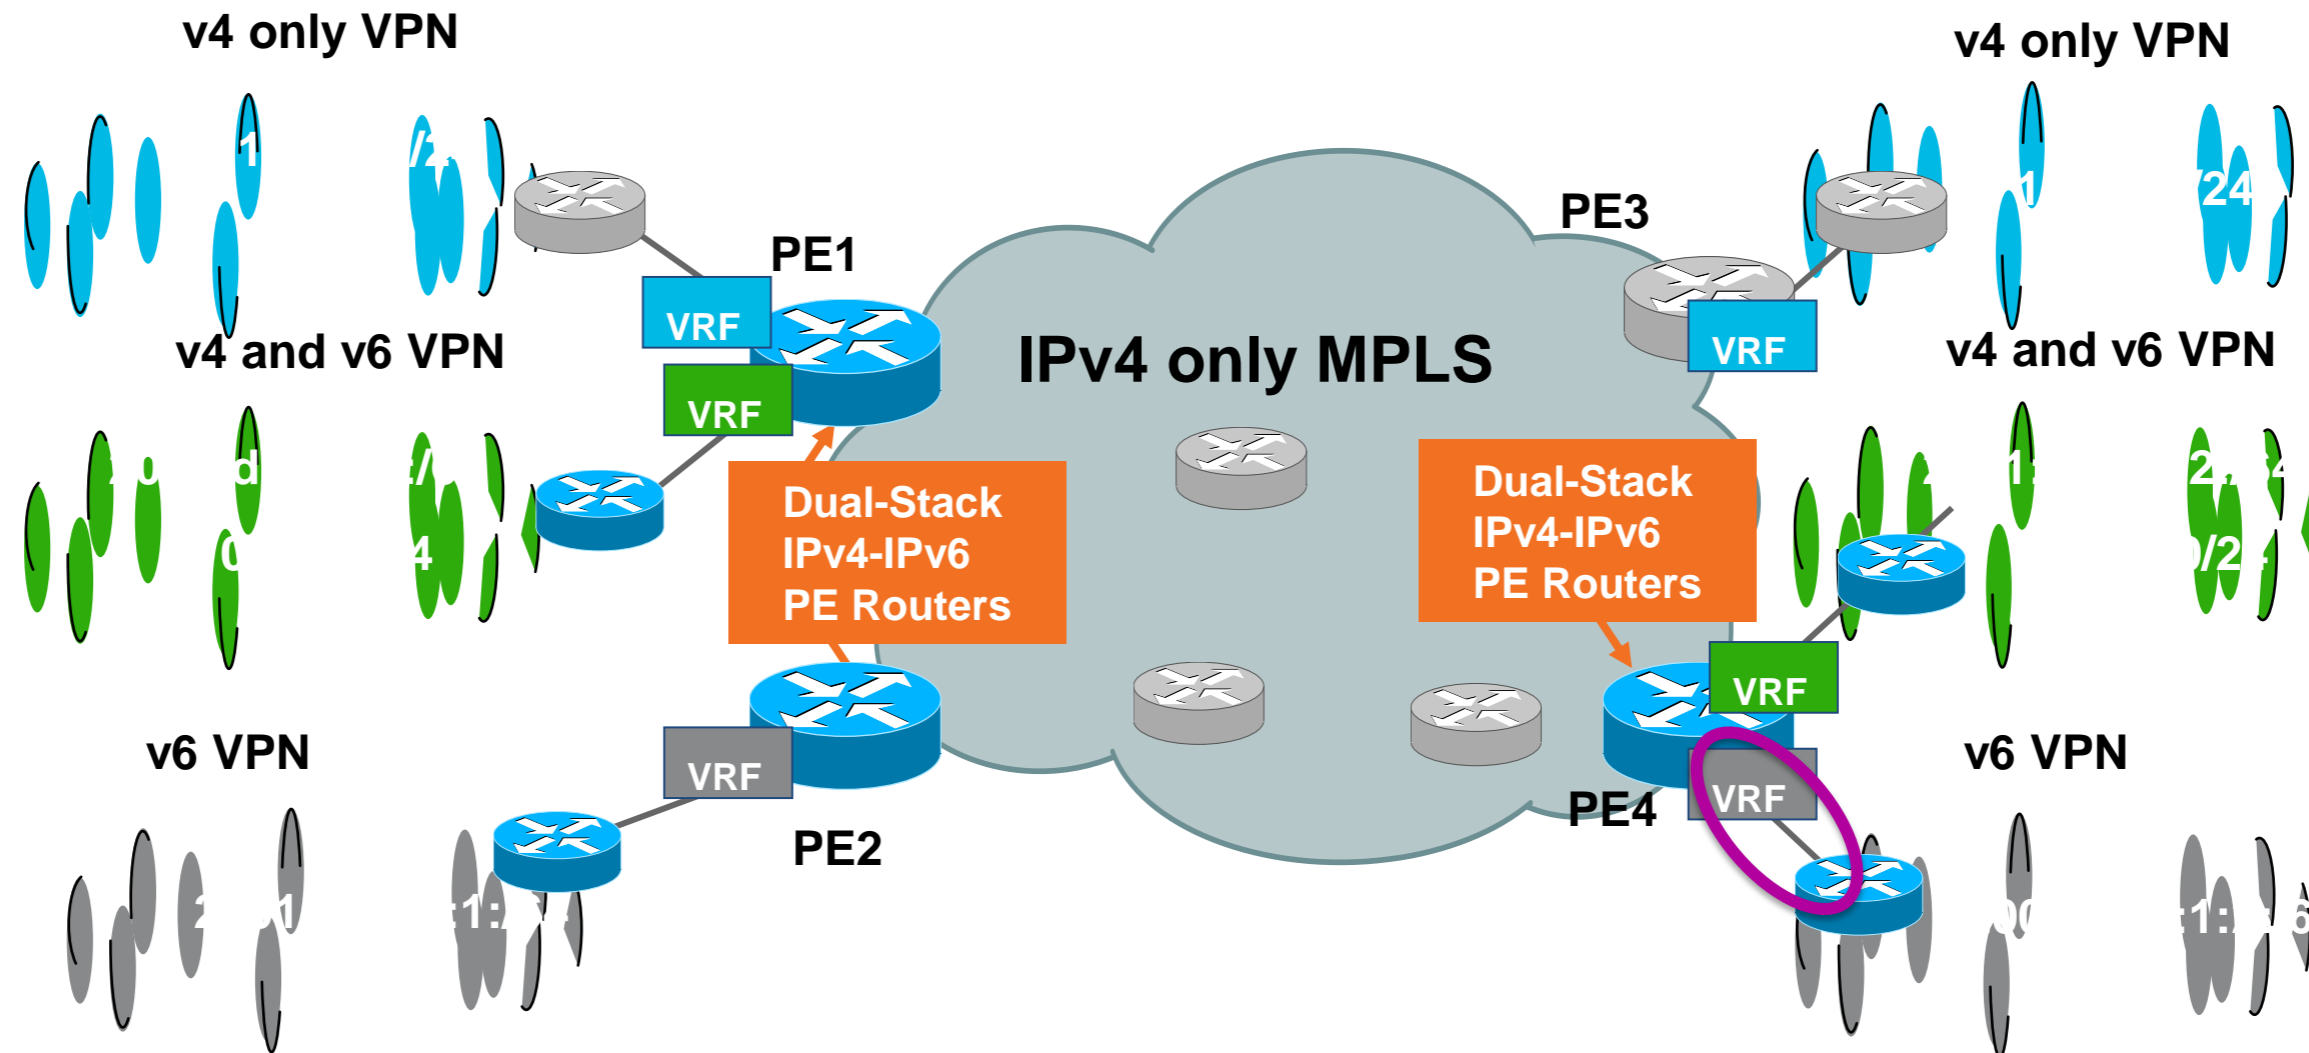

- Rogue tunnels by naïve users:
 - Sure, block IP protocol 41 and UDP/3544
 - In Windows:

```
netsh interface 6to4 set state state=disabled undoonstop=disabled
netsh interface isatap set state state=disabled
netsh interface teredo set state type=disabled
```

- Really rogue tunnels (covert channels)
 - No easy way...
 - Teredo will run over a different UDP port of course
 - Network devices can be your friend (more to come)
- **Deploying native IPv6 (including IPv6 firewalls and IPS) is probably a better alternative**
- **Or disable IPv6 on Windows through registry**
 - **HKLM\SYSTEM\CurrentControlSet\Services\tcpip6\Parameters\DisabledComponents**
 - **But Microsoft does not test any Windows application with IPv6 disabled**

SP Transition Mechanism: 6VPE

- 6VPE: the MPLS-VPN extension to also transport IPv6 traffic over a MPLS cloud and IPv4 BGP sessions

6VPE Security

- 6PE (dual stack without VPN) is a simple case
- Security is identical to IPv4 MPLS-VPN, see RFC 4381
- Security depends on correct operation and implementation
 - QoS prevent flooding attack from one VPN to another one
 - PE routers must be secured: AAA, iACL, CoPP ...
- **MPLS backbones can be more secure than “normal” IP backbones**
 - Core not accessible from outside
 - Separate control and data planes
- PE security
 - Advantage: Only PE-CE interfaces accessible from outside
 - Makes security easier than in “normal” networks
 - **IPv6 advantage: PE-CE interfaces can use link-local for routing**
=> completely unreachable from remote (better than IPv4)

Enforcing a Security Policy

PCI DSS Compliance and IPv6

- Payment Card Industry Data Security Standard *(latest revision October 2010)*:
 - **Requirement 1.3.8** *Do not disclose private IP addresses and routing information to unauthorised parties.*
 - *Note: Methods to obscure IP addressing may include, but are not limited to:*
 - *Network Address Translation (NAT)*
- There is no NAT n:1 IPv6 <-> IPv6 in most of the firewalls
 - RFC 6296 Network Prefix Translation for IPv6 (NPT6) is stateless 1:1 where inbound traffic is always mapped.
 - RFC 6296 is mainly for multi-homing and does not have any security benefit (not that NAT n:1 has any...)
- → use application proxies to comply with PCI DSS
- PCI DSS 2.0 Third Edition (December 2012) should be IPv6 aware

Cisco IOS IPv6 Extended Access Control Lists

- Very much like in IPv4
 - Filter traffic based on
 - Source and destination addresses
 - Next header presence
 - Layer 4 information
 - Implicit deny all at the end of ACL
 - Empty ACL means traffic allowed
 - Reflexive and time based ACL
- Known extension headers (HbH, AH, RH, MH, destination, fragment) are scanned until:
 - Layer 4 header found
 - Unknown extension header is found
- Side note for 7600 & other switches:
 - VLAN ACL only in 15.0(1)SY
 - Port ACL on Nexus-7000, Cat 3750 (12.2(46)SE not in base image), Cat 4K (12.2(54)SG), Cat 6K (12.3(33)SXI4)

IOS IPv6 Extended ACL

- Can match on
 - Upper layers: TCP, UDP, SCTP port numbers, ICMPv6 code and type
 - TCP flags SYN, ACK, FIN, PUSH, URG, RST
 - Traffic class (only six bits/8) = DSCP, Flow label (0-0xFFFFF)
- IPv6 extension header
 - **routing** matches any RH, **routing-type** matches specific RH
 - **mobility** matches any MH, **mobility-type** matches specific MH
 - **dest-option** matches any destination options
 - **auth** matches AH
 - **hbh** matches hop-by-hop (since 15.2(3)T)
- **fragments** keyword matches
 - Non-initial fragments (same as IPv4)
 - **And** the first fragment if the L4 protocol cannot be determined
- **undetermined-transport** keyword does not match
 - TCP/UDP/SCTP and ports are in the fragment
 - ICMP and type and code are in the fragment
 - Everything else matches (including OSPFv3, ...)
 - Only for deny ACE

Check your platform & release as your mileage can vary...

IPv6 ACL Implicit Rules

RFC 4890

- Implicit entries exist at the end of each IPv6 ACL to allow neighbour discovery:

```
permit icmp any any nd-na  
permit icmp any any nd-ns  
deny ipv6 any any
```

- Nexus 7000 also allows RS & RA

IPv6 ACL Implicit Rules – Cont.

Adding a deny-log

- The beginner's mistake is to add a deny log at the end of IPv6 ACL

```
. . .  
! Now log all denied packets  
deny ipv6 any any log  
! Heu . . . I forget about these implicit lines  
permit icmp any any nd-na  
permit icmp any any nd-ns  
deny ipv6 any any
```

- Solution, explicitly add the implicit ACE

```
. . .  
! Now log all denied packets  
permit icmp any any nd-na  
permit icmp any any nd-ns  
deny ipv6 any any log
```

Example: Rogue RA & DHCP Port ACL

For Your
Reference

```
ipv6 access-list ACCESS_PORT
  remark for paranoid, block 1st fragment w/o L4 info
  deny ipv6 any any undetermined-transport
  remark Block all traffic DHCP server -> client
  deny udp any eq 547 any eq 546
  remark Block Router Advertisements
  deny icmp any any router-advertisement
  permit ipv6 any any
```

```
Interface gigabitethernet 1/0/1
  switchport
  ipv6 traffic-filter ACCESS_PORT in
```

Note: PACL replaces RACL for the interface (or is merged with RACL 'access-group mode prefer port')
In August 2010, Nexus-7000, Cat 3750 12.2(46)SE, Cat 4500 12.2(54)SG and Cat 6500 12.2(33)SX14

IPv6 ACL to Protect VTY

For Your
Reference

```
ipv6 access-list VTY
  permit ipv6 2001:db8:0:1::/64 any

line vty 0 4
  ipv6 access-class VTY in
```

MUST BE DONE before '*ipv6 enable*' on any interface!

Does not exist for protecting HTTP server => use ACL

Control Plane Policing for IPv6

Protecting the Router CPU

- Against DoS with NDP, Hop-by-Hop, Hop Limit Expiration...
- Software routers (ISR, 7200): works with CoPPr (CEF exceptions)

```
policy-map COPPr
  class ICMP6_CLASS
    police 8000
  class OSPF_CLASS
    police 200000
  class class-default
    police 8000
!
control-plane cef-exception
service-policy input COPPr
```

- Cat 6K & 7600
 - IPv6 shares mls rate-limit with IPv4 for NDP & HL expiration

```
mls rate-limit all ttl-failure 1000
mls rate-limit unicast cef glean 1000
```

ASA Firewall IPv6 Support

- Since version 7.0 (April 2005)
- Dual-stack, IPv6-only, IPv4-only
- Extended IP ACL with stateful inspection
- Application awareness: TTP, FTP, telnet, SMTP, TCP, SSH, UDP
- uRPF and v6 Frag guard
- IPv6 header security checks (length & order)
- Management access via IPv6: Telnet, SSH, HTTPS
- ASDM support (ASA 8.2)
- Routed & transparent mode (ASA 8.2)
- Fail-over support (ASA 8.2.2)
- Selective permit/deny of extension headers (ASA 8.4.2)
- OSPFv3, DHCPv6 relay, stateful NAT64/46/66 (ASA 9.0)

ASA 8.4.2 : IPv6 Extension Header Filtering

The image shows a screenshot of the Cisco ASA 8.4.2 configuration interface, specifically the 'Edit Service Policy Rule' window. The 'Protocol Inspection' tab is active, and the 'IPv6' checkbox is selected. A red box highlights the 'IPv6' checkbox and its 'Configure...' button. A red arrow points from this button to the 'Add IPv6 Inspect Map' dialog box.

The 'Add IPv6 Inspect Map' dialog box has the following fields and options:

- Name: inspect_v6
- Description: (empty)
- Enforcement: Header Matches
- Permit only known extension headers
- Enforce extension header order

A red arrow points from the 'Header Matches' tab to the 'Add IPv6 Inspect' dialog box.

The 'Add IPv6 Inspect' dialog box has the following fields and options:

- Match Criteria: (empty)
- Criterion: Authentication (AH) header
- Value: (empty)
- Not applicable: Encapsulating Security Payload (ESP) header
- Actions: (empty)
- Action: (empty)
- Log: (empty)

The 'Add IPv6 Inspect' dialog box also has a list of header types: Authentication (AH) header, Destination Options header, Encapsulating Security Payload (ESP) header, Fragment header (highlighted), Hop-by-Hop Options header, Routing header, and Routing header addresses count.

ASA 9.0 Mixed Mode Objects

IPS Supports IPv6

- Since IPS 6.2 (November 2008)
- Engines
 - Specific to IPv6
 - Common to IPv4 and IPv6
 - TCP reset works over IPv4
- *IPS Manager Express* can view IPv6 events
- *IPS Device Manager* can configure IPv6
- **All management plane is over IPv4 only**
 - Not critical for most customers

Dual-Stack IPS Engines

Service HTTP

The screenshot shows the Cisco IPS Manager Express 7.0.1 interface. The 'Event Monitoring' tab is active, displaying 'Event Views'. The 'View Settings' section is visible, including 'Filter Name: Basic Filter', 'Packet Parameters' (Attacker IP, Victim IP, Signature Name/ID, Victim Port), 'Rating and Action Parameters' (Severity, Risk Rating, Threat Rating, Action(s) Taken), and 'Other Parameters' (Sensor Name(s), Virtual Sensor, Status, Vict. Locality). Below the settings is a table of events with columns: Severity, Date, Time, Device, Sig. Name, Sig. ID, Attacker IP, Victim IP, Victim Port, and Threat Rating. Two events are listed, both with a severity of 'low' and a signature name of 'Dot Dot Slash in URI'. The first event occurred on 06/11/2009 at 17:06:56 on device 4240-munsec, with attacker IP 192.168.200.46 and victim IP 192.168.200.38. The second event occurred at 17:07:14 on the same device, with attacker IP 2001:db8:0:0:0:0:46 and victim IP 2001:db8:0:0:0:0:38. A red box highlights the 'Sig. Name' and 'Sig. ID' columns in the table.

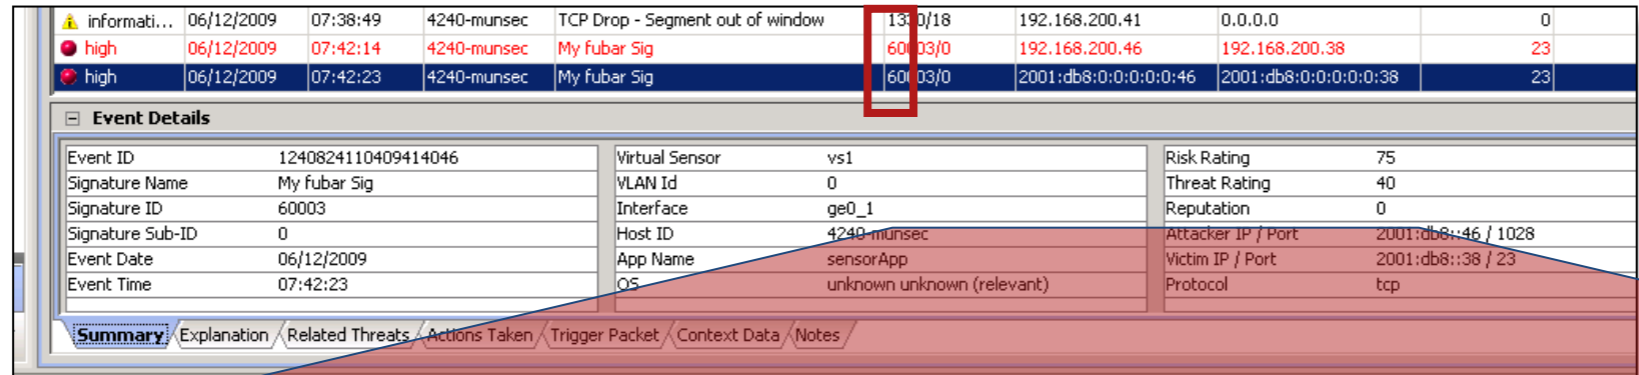

Severity	Date	Time	Device	Sig. Name	Sig. ID	Attacker IP	Victim IP	Victim Port	Threat Rating
low	06/11/2009	17:06:56	4240-munsec	Dot Dot Slash in URI	5256/0	192.168.200.46	192.168.200.38	80	52
low	06/11/2009	17:07:14	4240-munsec	Dot Dot Slash in URI	5256/0	2001:db8:0:0:0:0:46	2001:db8:0:0:0:0:38	80	42

	Sig. Name	Sig. ID	Attacker IP	Victim IP	Victim Port	Th
c	Dot Dot Slash in URI	5256/0	192.168.200.46	192.168.200.38	80	
c	Dot Dot Slash in URI	5256/0	2001:db8:0:0:0:0:46	2001:db8:0:0:0:0:38	80	

Dual-Stack Engine

String TCP with Custom Signature

- Yet another example of an engine supporting both IPv4 and IPv6

60003/0	192.168.200.46	192.168.200.38
60003/0	2001:db8:0:0:0:0:0:46	2001:db8:0:0:0:0:0:38

IPv6-Only Engines

- Atomic IPv6 (mostly obsolete)
- Atomic IP Advanced
 - Routing Header type 0
 - Hop-by-Hop
 - ...
- Missing
 - Rogue RA
 - Rogue NA

1700/0	IPv6 Hop-by-Hop Options Present
1701/0	IPv6 Destination Options Header Present
1702/0	IPv6 Routing Header Present
1703/0	IPv6 Fragmented Traffic
1704/0	IPv6 Authentication Header Present
1705/0	IPv6 ESP Header Present
1706/0	Invalid IPv6 Header Traffic Class Field
1707/0	Invalid IPv6 Header Flow Label Field
1710/0	IPv6 Extensions Headers Out Of Order
1711/0	Duplicate IPv6 Extension Headers
1712/0	IPv6 Packet Contains Duplicate Src And Dst Address
1713/0	IPv6 Header Contains Multicast Source Address
1714/0	IPv6 Address Set To localhost
1716/0	IPv6 Options Padding Too Long
1717/0	Back To Back Padding Options
1718/0	IPv6 Option Data Too Short
1719/0	IPv6 Endpoint Identification Option Set
1720/0	IPv6 Jumbo Payload Option Set
1721/0	IPv6 Double Next Option Set

Summary of Cisco IPv6 Security Products

- ASA Firewall
 - Since version 7.0 (released 2005)
 - Flexibility: Dual stack, IPv6 only, IPv4 only
 - SSL VPN for IPv6 over IPv4 (ASA 8.0) over IPv6 (ASA 9.0)
 - Stateful-Failover (ASA 8.2.2)
 - Extension header filtering and inspection (ASA 8.4.2)
 - Dual-stack ACL & object grouping (ASA 9.0)
- ASA-SM
 - Leverage ASA code base, same features ;-) 16 Gbps of IPv6 throughput
- FWSM
 - IPv6 in software... 80 Mbps ... Not an option (put an IPv6-only ASA in parallel or migrate to ASA-SM)
- IOS Firewall
 - IOS 12.3(7)T (released 2005)
 - Zone-based firewall on IOS-XE 3.6 (2012)
- IPS
 - Since 6.2 (released 2008)
- Email Security Appliance (ESA) under beta testing since 2010, IPv6 support since 7.6.1 (May 2012)
- Web Security Appliance (WSA) with explicit proxy then transparent mode, work in progress (end of 2013)
- ScanSafe expected to be available in 2012

Security IPv6 Connectivity

Secure IPv6 over IPv4/6 Public Internet

- No traffic sniffing
- No traffic injection
- No service theft

Public Network	Site 2 Site	Remote Access
IPv4	<ul style="list-style-type: none">▪ 6in4/GRE Tunnels Protected by IPsec▪ DMVPN 12.4(20)T	<ul style="list-style-type: none">▪ ISATAP Protected by RA IPsec▪ SSL VPN Client AnyConnect
IPv6	<ul style="list-style-type: none">• IPsec VTI 12.4(6)T• DMVPN 15.2(1)T	<ul style="list-style-type: none">• AnyConnect 3.1 & ASA 9.0

Secure Site to Site IPv6 Traffic over IPv4 Public Network with DMVPN

- IPv6 packets over DMVPN IPv4 tunnels
 - In IOS release 12.4(20)T (July 2008)
 - In IOS-XE release 3.5 (end 2011)
 - IPv6 and/or IPv4 data packets over same GRE tunnel
- Complete set of NHRP commands
 - network-id, holdtime, authentication, map, etc.
- NHRP registers two addresses
 - Link-local** for routing protocol (Automatic or Manual)
 - Global** for packet forwarding (Mandatory)

DMVPN for IPv6

Phase 1 Configuration

For Your
Reference

Hub

```
interface Tunnel0
!... IPv4 DMVPN configuration may be required...
  ipv6 address 2001:db8:100::1/64
  ipv6 eigrp 1
  no ipv6 split-horizon eigrp 1
  no ipv6 next-hop-self eigrp 1
  ipv6 nhrp map multicast dynamic
  ipv6 nhrp network-id 100006
  ipv6 nhrp holdtime 300
  tunnel source Serial2/0
  tunnel mode gre multipoint
  tunnel protection ipsec profile vpnprof
!
interface Ethernet0/0
  ipv6 address 2001:db8:0::1/64
  ipv6 eigrp 1
!
interface Serial2/0
  ip address 172.17.0.1 255.255.255.252
!
  ipv6 router eigrp 1
  no shutdown
```

Spoke

```
interface Tunnel0
!... IPv4 DMVPN configuration may be required...
  ipv6 address 2001:db8:100::11/64

interface Serial1/0
  ip address 172.16.1.1 255.255.255.252
!
  ipv6 router eigrp 1
  no shutdown
```

Secure Site to Site IPv6 Traffic over IPv6 Public Network

For Your Reference

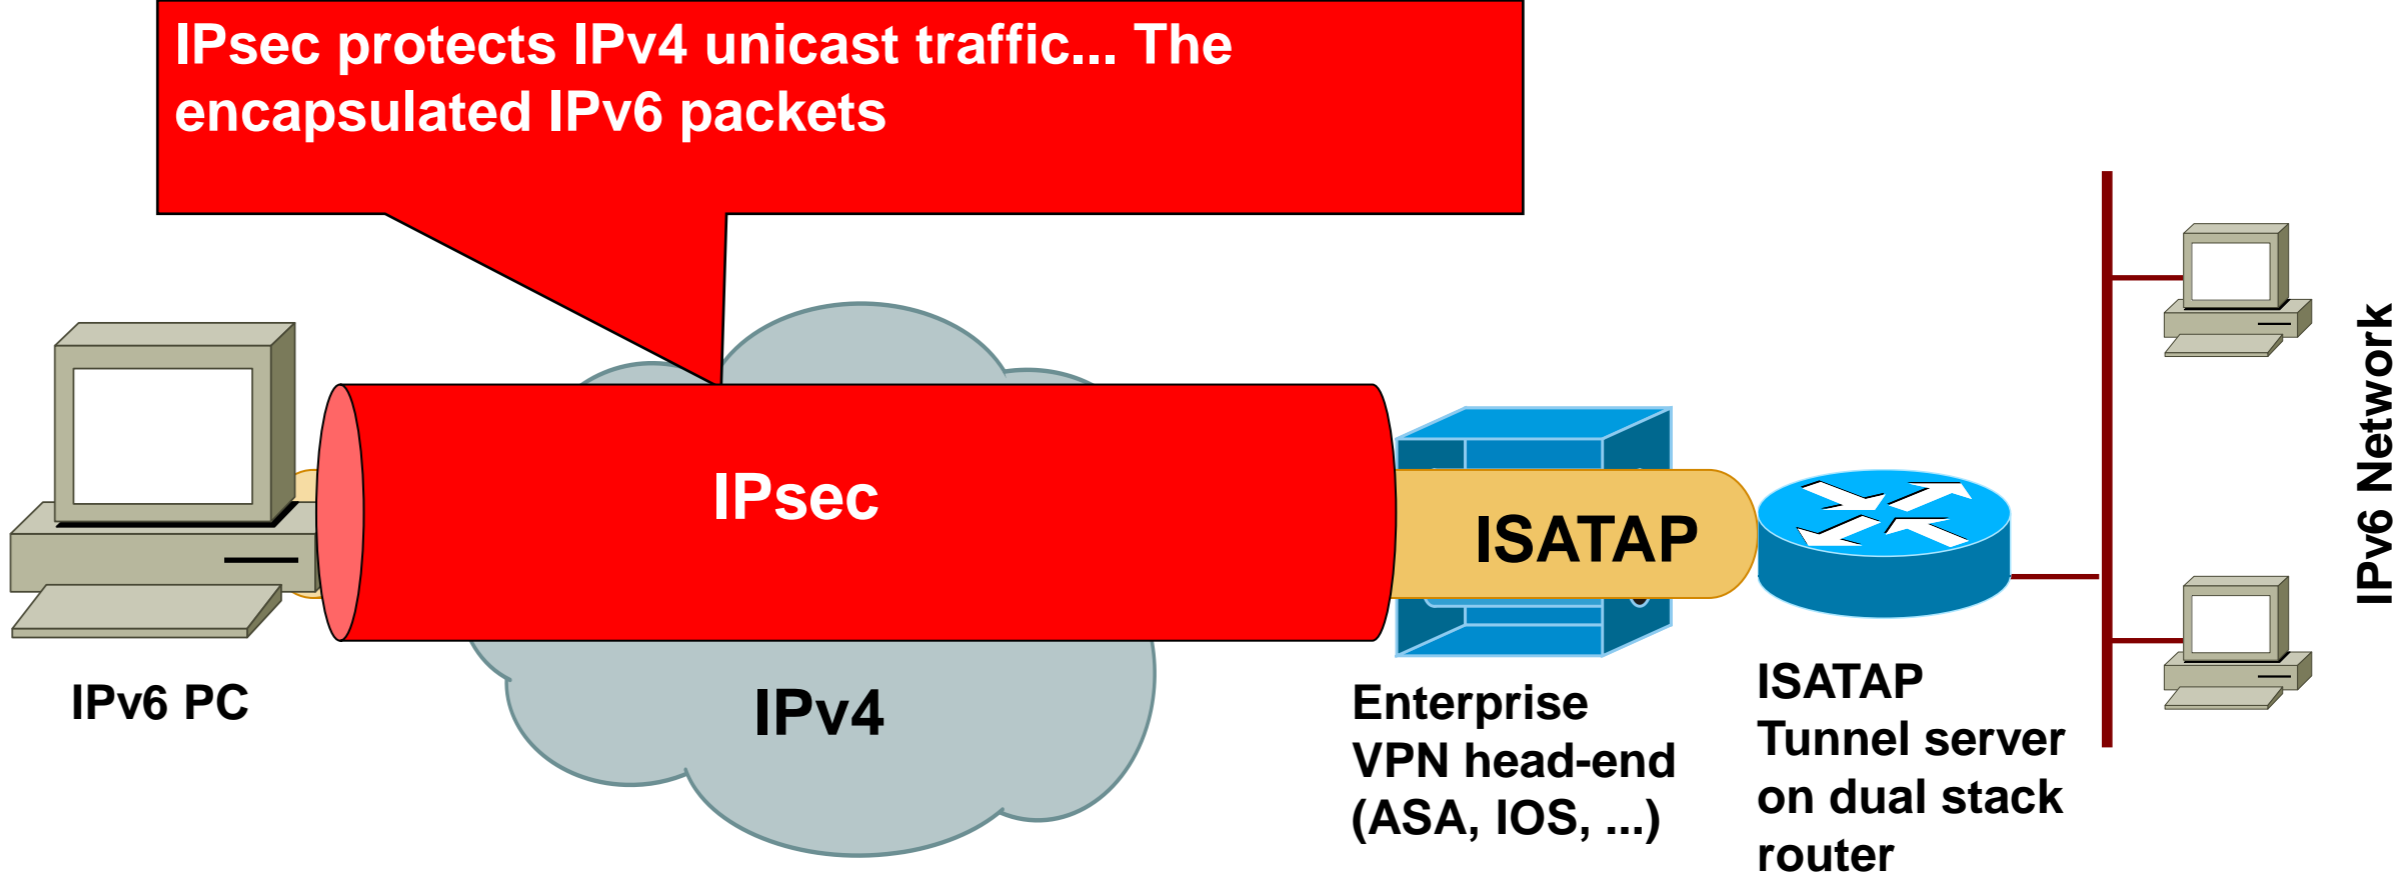

- Since 12.4(6)T, IPsec also works for IPv6
- Using the Virtual Interface

```
interface Tunnel0
  no ip address
  ipv6 address 2001:DB8::2811/64
  ipv6 enable
  tunnel source Serial0/0/1
  tunnel destination 2001:DB8:7::2
  tunnel mode ipsec ipv6
  tunnel protection ipsec profile ipv6
```

IPv6 for Remote Devices Solutions

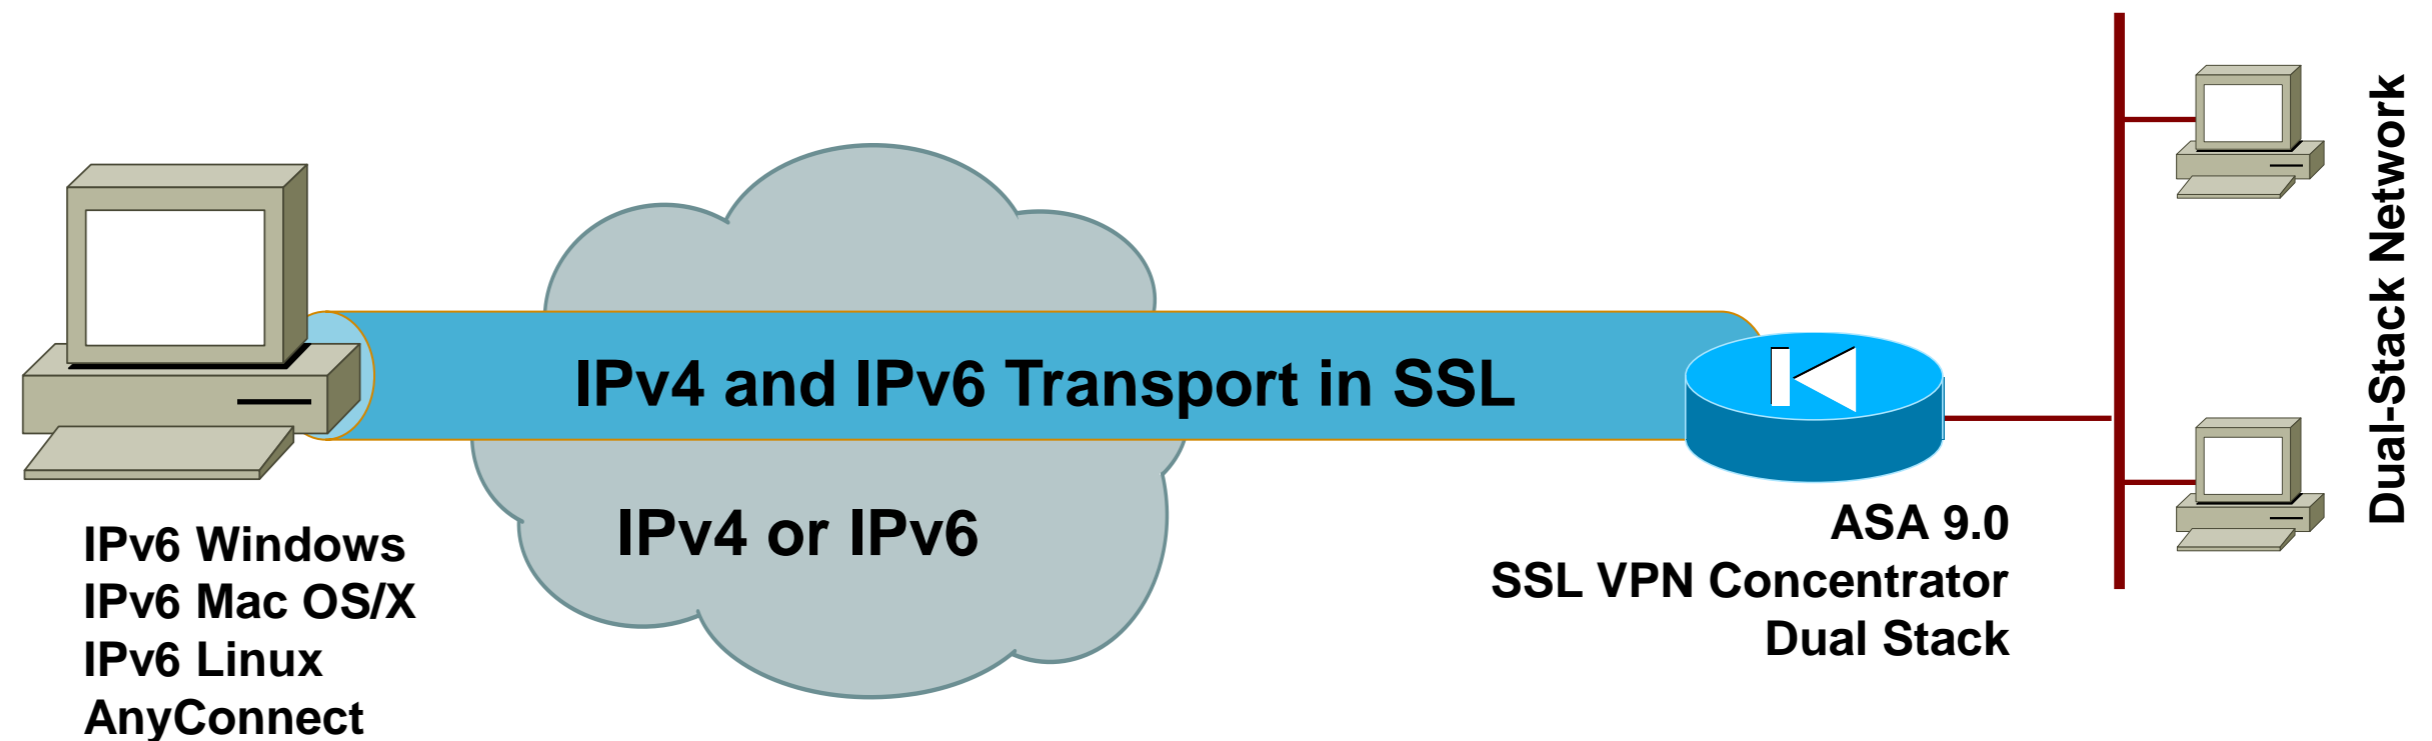

- Enabling IPv6 traffic inside the Cisco VPN Client tunnel
 - NAT and Firewall traversal support
 - Allow remote host to establish a v6-in-v4 tunnel either automatically or manually
 - ISATAP—Intra Site Automatic Tunnel Addressing Protocol
 - Fixed IPv6 address enables server's side of any application to be configured on an IPv6 host that could roam over the world
- Use of ASA 8.0 and SSL VPN Client AnyConnect 3.0 (Windows, Android, iPhone)
 - Can transfer IPv4+IPv6 traffic over public IPv4
 - DNS is still IPv4-only, no split tunnelling only
 - Mid-2012 with ASA and AnyConnect, IPv4+IPv6 traffic over public IPv6 and over IPsec or SSL *(roadmap, date can change)*

Secure RA IPv6 Traffic over IPv4 Public Network: ISATAP in IPsec

IPsec with NAT-T can traverse NAT
ISATAP encapsulates IPv6 into IPv4

Secure RA IPv* over IPv* Public Network: AnyConnect SSL VPN Client 3.1 & ASA 9.0

Summary

Key Take Away

- So, nothing really new in IPv6
 - Reconnaissance: address enumeration replaced by DNS enumeration
 - Spoofing & bogons: uRPF is our IP-agnostic friend
 - NDP spoofing: RA guard and more feature coming
 - ICMPv6 firewalls need to change policy to allow NDP
 - Extension headers: firewall & ACL can process them
 - Amplification attacks by multicast mostly impossible
 - Potential loops between tunnel endpoints: ACL must be used
- Lack of operation experience may hinder security for a while: **training is required**
- Security enforcement is possible
 - Control your IPv6 traffic as you do for IPv4
- Leverage IPsec to secure IPv6 when suitable

Is IPv6 in My Network?

- Easy to check!
- Look inside NetFlow records
 - Protocol 41: IPv6 over IPv4 or 6to4 tunnels
 - IPv4 address: 192.88.99.1 (6to4 anycast server)
 - UDP 3544, the public part of Teredo, yet another tunnel
- Look into DNS server log for resolution of ISATAP
- Beware of the IPv6 latent threat: ***your IPv4-only network may be vulnerable to IPv6 attacks NOW***
